Abstract

The first open session after the federal holiday. The queue staged on the closed day is released against six checks, the six orders are entered in a sequence set by an auction cutoff rather than by preference, the follow-ups that have earned their three-business-day interval are sent and the ones that have not are withheld, and the block closes with a record of what was asked of whom.

The block began with one external fact: the FDA approved Rasonque (daraxonrasib) on August 26, 2026 [1]. Five days later it has produced twenty-four letters, thirteen technical briefs, nine form and filing packs, five capital instruction sets, fifteen figures and twenty-five tables, and it has closed with a weekly cadence that makes the next block a substitution of content into a known frame rather than a fresh design.

Nothing in the block is an agreement, an offering, an award, or a submission of record. Every quantity in it carries the limitation its own authors stated, and four diligence questions are recorded as having no answer at all.

1 What the Block Produced

Twenty-four letters went to federal program offices, an agent's developer, regional investors, securities counsel, two clinical institutions, two disease foundations, a clinical trial support service, an FDA classification office, a congressional district office, two state and regional programs, and a broker-dealer. Two of the twenty-four were filed rather than sent, and three were withheld because their interval had not elapsed.

Nine form and filing packs were completed. Two were filed, two were completed and deliberately held until a first sale that has not happened, two were completed and held until an institution names an investigator, two were completed offline against portals whose support desks were closed, and one is a checklist rather than a submission.

Five capital instruction sets moved the company's own reserve from a single sweep to a four-rung ladder, added a conditional branch against a financing that has not been taken, sized a site start-up pool that is committed to nobody, queued six orders on a day the market was closed, and entered them on a day it was open.

1.1 How to read this

A reader with five minutes takes §5, the record table. Every row stands without reading a file, which is the property it was written for.

A reader with fifteen minutes adds §3, the pipeline, and §4, the cadence: what is in flight and what happens every week from here.

A reader auditing the execution itself takes §1 and §2: the six checks, the entry sequence, the settlement basis, and the fill record. §6 carries the positioning constraints, the method note, and the references.

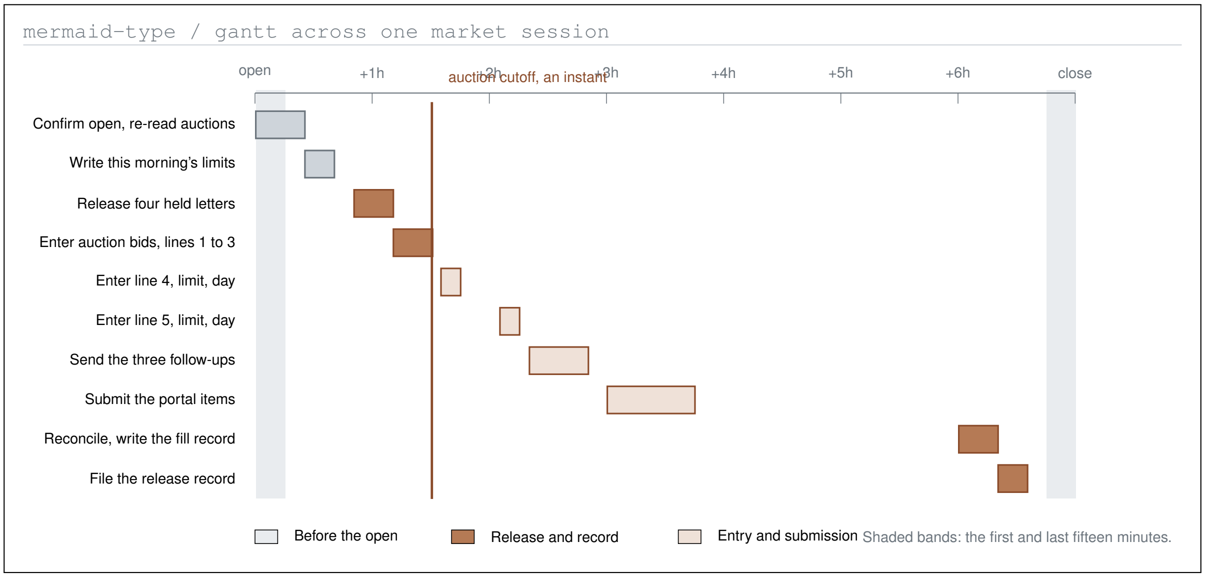

Figure 13. One open market session, with the release and execution steps in sequence and the auction cutoff drawn as an instant that constrains them all.

2 The Release

Six checks precede any transmission, and any one of them failing stops the entry. They are restated here rather than referenced, because a check nobody can find is a check nobody runs.

The market is open, confirmed against the exchange calendar rather than assumed. The release approval was given on the preceding day and is unchanged overnight. The financing branch is unchanged, so the queue stands as cut against the nine-month horizon rather than being amended after entry. The auction calendar has been re-read this morning, because auctions do not settle on a federal holiday and a calendar read before one is wrong for the week after it [2]. The limit prices were written this morning from the last completed session's close. And the reserve balance is current, since every order size is a share of it.

2.1 What was released, and what was withheld

Item	Released	The dependency, or the reason it was withheld
Congressional district letter	Yes	Held from the closed day; district offices are open
State finance center letter	Yes	The same
Regional development letter	Yes	The same
FDA Pre-Request for Designation	Yes	The same. The most consequential item in the block
Federal follow-up, round two	Yes	Three business days elapsed since the day 1 letters
Developer follow-up, window only	Yes	Three business days elapsed; one question, not two
Six queued orders	Yes	Six checks passed, in the sequence an auction cutoff sets
Portal submissions	Yes	Support desks open again
Site follow-up	**No**	Only two business days have elapsed since the day 3 letters
Foundation follow-up	**No**	The same
Site meeting confirmation	Conditional	Sent only if an institution replied; otherwise left unsent

Table 21. Eleven items with whether each was released, and the interval or dependency that decided it, including the three deliberately withheld.

2.2 Why the withheld items matter more than the released ones

A block that releases everything it has written is a block with no discipline in it. The federal holiday is not a business day, which makes this the third business day after day 1 and only the second after day 3. A site that receives a follow-up on the second business day reads a company counting hours, and the impression outlasts the letter.

The conditional item is the same principle in a different form. A confirmation letter with nothing to confirm is a second request wearing a confirmation's clothes, and recipients notice.

3 Execution and Settlement

Six lines are entered in an order set by an external constraint rather than by preference. The auction cutoff is a hard stop and a limit order is not, so the auction bids go first.

#	Instrument	Size	Entry	Settlement basis, and what is recorded
1	Treasury bill, about 3 months	20 pct	First, auction	Auction settlement date on the announcement; CUSIP, par, discount price, maturity
2	Treasury bill, about 6 months	20 pct	First, auction	The same
3	Treasury bill, about 9 months	20 pct	First, auction	The same
4	Treasury note or bill, about 12 months	20 pct	Second, limit, day	Regular way secondary; CUSIP, par, price, trade and settlement dates
5	Short-duration Treasury ETF	15 pct	Third, limit, day, mid-session	Standard fund settlement; ticker, shares, execution price, dates
6	Government money market sweep	5 pct	Automatic	Overnight; balance only

Table 24. Six lines with size, entry order, and settlement basis, in the sequence an external auction cutoff imposes rather than one chosen freely.

3.1 The record written on the day of the fill

Not at quarter end. A ledger written from statements three months later reconciles to the statements and to nothing else. Every line records its instrument identifier, side and quantity, price, trade date, settlement date, maturity date where it has one, the share of reserve it represented on the morning of entry, and a confirmation that auto-reinvestment is off.

Treasury bills are issued at a discount and the accretion is interest income for federal purposes recognized at maturity or sale. Interest on direct United States Treasury obligations is exempt from California personal income tax and the exemption flows through a single-member limited liability company treated as a disregarded entity, subject to confirmation by the company's tax preparer [3].

3.2 If a line does not fill

An auction line that misses a cutoff is carried to the next auction. It is not replaced by a secondary purchase at a worse basis in order to feel finished. A limit line that is not reached is canceled at the close and re-priced the next morning, and **is never converted to a market order to complete a day**.

That last instruction is the most important line in this section. A ladder built to avoid being forced should not be completed by forcing it, and the temptation to do so arrives precisely on the day the rest of the block went well.

3.3 Reconciliation at the close

Every line either filled or is recorded as unfilled with a reason, so no line is unaccounted for. The six shares sum to one hundred percent of the reserve as of this morning. No position outside the authorized set exists in the account, which is a control question rather than a preference question. Auto-reinvestment is off on every rung, confirmed in the account settings rather than in an order ticket. And there is no margin balance, no option position, and no lending consent.

3.4 Why the entry order is not a preference

An auction cutoff is external, published, and unforgiving: a non-competitive bid submitted after a broker's internal cutoff is not submitted at all, and the next opportunity is the following auction. A limit order is none of those things; it rests through the session and can be canceled at the close and re-priced tomorrow.

Sequencing therefore follows the constraint rather than the convenience. The three auction lines go first because they are the only lines whose window can close while the rest of the session is still open, and the exchange-traded line goes last because its only timing constraint is internal, which is that it is not entered in the first or last fifteen minutes of the session.

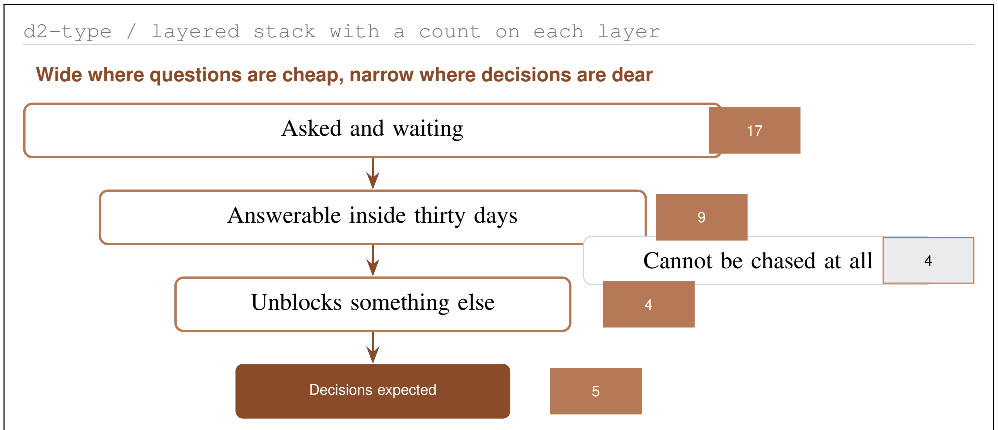
The general rule is worth naming because it recurs: where one action has an external deadline and another does not, the external one goes first even when the other is more urgent to the person doing it.

The rule has a cost, and the cost is that the most consequential action of a given day is frequently not the first one taken. That inversion is uncomfortable and it is correct. Urgency is a property of the person holding the list, while a cutoff is a property of the world, and only one of the two moves when a founder decides it should. Writing the sequence down the night before is what keeps the distinction intact at nine in the morning, when the temptation is to begin with whatever felt largest at breakfast.

3.5 The single approval step

One decision is open on this day

Approve the release, confirming that nothing changed overnight that would invalidate the preceding day's authorization, and adopt the weekly cadence in §4. The release is mechanical and is governed by the six checks in §1; the cadence is the decision that makes the next block a substitution of content into a known frame rather than a fresh design. Nothing in §2 is investment advice, and no order is entered except against its checks.



No edge reaches the side layer, and the absence is the point. The four items there are not a stage of the funnel: they arrive on somebody else's calendar, and drawing a connector would suggest they can be moved along.

Figure 15. The thirty-day pipeline as four narrowing layers, with the four items that cannot be chased drawn outside the funnel rather than inside it.

4 The Thirty-Day Pipeline

One rule governs this section: an item whose next action belongs to this company is not pipeline. It is work, and it belongs on a to-do list. Confusing the two produces a pipeline that looks busy and moves nothing, and a founder who reads it feels productive without being so.

Every row below therefore waits on somebody else.

Stage	Count	Interval basis	What the stage contains
Asked and waiting	17	Varies by counterparty	Every open item across federal, commercial, institutional, state and regional
Answerable inside thirty days	9	5 to 15 business days	Those whose stated interval is short enough to resolve in the window
Unblocks something else	4	No interval; each is routed	The four diligence questions with no answer today
Decisions expected	5	If nothing goes wrong	One classification, one determination, one instrument, one site routing, and zero to three federal replies
Cannot be chased at all	4	Somebody else's calendar	Classification, foundation cycle, developer window, review board calendar

Table 22. Five pipeline stages with their counts and the basis of each interval, including the four items no action by this company can advance.

4.1 The four that cannot be chased, named separately

The FDA classification arrives when it arrives, and an applicant who chases a classification request is an applicant the office remembers [4]. A foundation cycle runs on published dates that are not negotiable. A developer submission window opens on the developer's calendar. An institutional review board meets when it meets.

Naming these four separately matters for a practical reason. A founder with time and anxiety will chase something, and it should not be one of these.

4.2 What thirty days produce if nothing goes wrong

Five decisions, four of which unblock something else. That is a reasonable month for a company of one person. If nothing arrives at all, the four unanswered diligence questions are unchanged and the stop conditions are unchanged, which is the honest downside and is already written down in the preceding day's packet rather than discovered later.

4.3 Why the pipeline is published rather than kept internally

A pipeline in a public repository is unusual and the reason is deliberate. A counterparty who reads it can see exactly where their own item sits, what interval this company has assigned to it, and that no action is planned before that interval elapses. That removes the most common source of friction in early correspondence, which is a recipient wondering whether silence will be read as a no and answered with a chase.

It also constrains this company. An interval published against a named counterparty is an interval that cannot quietly shorten because a founder became impatient on a Tuesday, and the four unchaseable items are protected by exactly that constraint.

The arrangement is not costless either. Publishing the pipeline tells every counterparty what every other counterparty was asked and when, and a reader who wanted to infer this company's order of preference from the intervals could do so. That inference would be wrong, because the intervals track how long each office states it needs rather than how much this company wants the answer, but the possibility of the wrong reading is real and is accepted rather than concealed. The alternative, which is an unpublished pipeline that no one can check, gives up more than it protects.

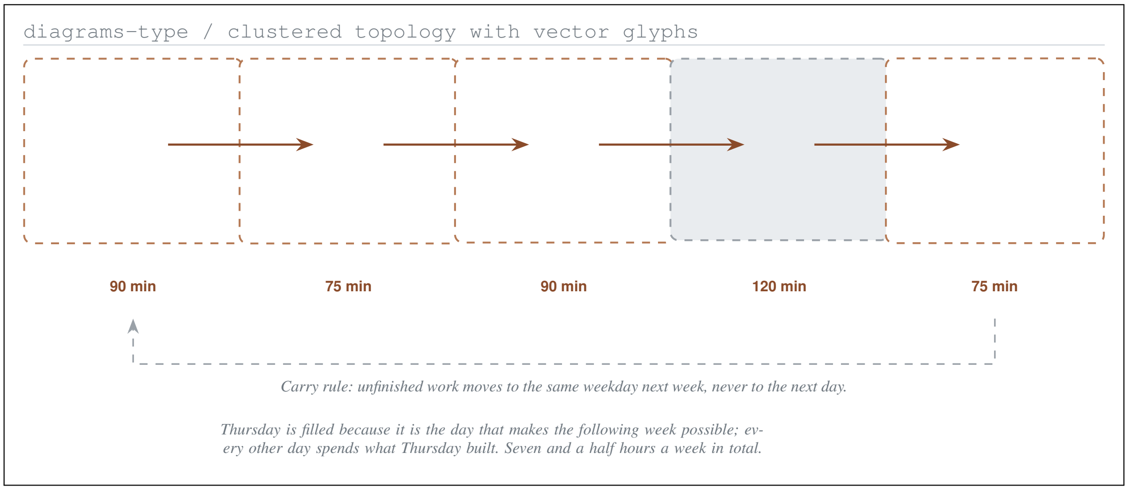


Figure 14. The weekly cadence as five standing functions with a time budget each, and the carry rule that moves unfinished work a week rather than a day.

5 The Weekly Cadence

The block just completed was designed from nothing, which cost more time in design than in execution. A week that produces five days of correspondence and no recurring rhythm has to be reinvented, so the block closes by fixing one.

Weekday	Theme	Budget	The artifact that must exist by the end of it
Monday	Federal	90 min	Sent letters, and any registration confirmed current
Tuesday	Capital	75 min	A capital decision recorded, or a written reason none was taken
Wednesday	Site and partner	90 min	Sent letters, and any meeting confirmed with an agenda attached
Thursday	Preparation	120 min	The data room updated, and next week's drafts written and held
Friday	Execution and record	75 min	Orders entered against their checks, follow-ups sent, the record table filed
Total	Five standing functions	**7.5 h**	One person, sustainable alongside the technical work

Table 23. The weekly cadence by weekday, with a time budget and the one artifact that must exist by the end of each day for the week to have held.

5.1 The three rules that make it survive a real week

A holiday moves the theme rather than deleting it: whichever weekday is closed becomes the preparation day, and the themes shift around it. That is exactly what the block just completed did, which is the evidence that the rule works.

No day runs over its budget. A Monday that takes three hours has borrowed from Thursday, and Thursday is the day that makes the following week possible.

Unfinished work is carried to the same weekday next week rather than squeezed into the next day. A cadence that reschedules within a week stops being a cadence by Wednesday.

5.2 What is deliberately not in the cadence

Fundraising conversations with no scheduled next action. Reading. Writing the technical artifacts themselves, which is the rest of the week and is not funding work [5]. And anything that would be chased rather than waited for: the four unchaseable items in §3 are checked on Thursday and never acted on.

5.3 How the next block is built from this

Take the five weekday themes, substitute the current content, and the design work is done. The block just completed maps onto the frame exactly, in order: federal, capital, site and partner, preparation, execution. That mapping was not accidental, and it is the argument that this is the right frame rather than a convenient one.

5.4 What the cadence costs, stated honestly

Seven and a half hours a week is roughly a fifth of a working week spent on funding rather than on the technical work that produces the artifacts funding describes. For a company of one person that is a real cost and it is worth naming rather than presenting the cadence as free.

The alternative is worse in a specific way. Funding work that has no fixed budget expands to fill whatever anxiety is available, and it does so on exactly the days when a deadline is near, which are the days the technical work is also most pressed. A fixed budget converts an unbounded claim on attention into a bounded one, and the bound is what makes the technical work survivable alongside it.

6 The Five-Day Record

One row per action. Every row states what was sent, to whom, and what it asked, and no row depends on a file being read. This is the table to hand somebody who joins the program in a month and needs to know what was already asked of whom, so that they do not ask it again.

6.1 How to read the table, and what one row is

A row is one action, not one document. Where a single letter went to several addresses at one organization, it is one row; where the same question went to two different organizations, it is two, because the answers are independent.

The recipient column names a class rather than an individual. Individuals are recorded in the correspondence folder of the data room, where they are behind a confidentiality agreement, because those addresses belong to people who did not consent to appearing in a public repository. A class is enough for the purpose this table serves, which is preventing a second person from asking the same organization the same question a month later.

The question column states what was asked and not what was claimed. That distinction is the reason the table is short enough to read: a record of claims would have to carry every limitation with every number, and the limitations live in the evidence pack where a reader who needs them will look.

Twenty-one rows, five days. Three further letters were written and withheld, and one was conditional; §5.2 below says which and why.

Day	To whom	What it asked
1	NIH SEED and SBIR program staff	Whether an approved agent changes the Phase I feasibility bar for a combined workflow
1	ARPA-H mission office	Whether gate 1 can be narrowed and repriced, since half of what it retired resolved externally
1	NCI Cancer Therapy Evaluation Program	Whether perioperative use of a newly approved agent is inside the concept pathway
1	NIH Common Fund and CSR review	Whether the science codes and the effort expectation change for a firm rather than an institution
1	The company's broker-dealer	Execution of a four-rung Treasury ladder cut to a nine-month horizon
2	The agent's developer, external research	A scientific feasibility conversation and the next submission window
2	Regional angel and syndicate screening	A screening conversation, with no offering term stated anywhere
2	Life science family offices	A read of the public portfolio, then a call if warranted
2	Securities counsel	An engagement on one instrument, two filings, and one eligibility question
2	The broker-dealer corporate desk	A subscription account opened and left unfunded
3	Cancer center leadership and surgical oncology	The right site principal investigator and trial operations contact
3	A research institute's digital trials group	A read of the public method portfolio and a view on its interest
3	Two disease foundations	Whether any mechanism can fund a company-sponsored Phase 1 with an academic site
3	Clinical trial support services	A sponsor-investigator determination and nine other start-up items
4	A congressional district office	Interest in a published federal review clock for combined AI and robotic workflows
4	A state small business finance center	Whether any state program fits a pre-revenue clinical research company
4	A regional development corporation	Introductions, and a view on regional life science programs
4	FDA Office of Combination Products	A preliminary classification and a lead center determination
5	The day 1 federal recipients	One follow-up carrying one new fact, and no restatement
5	The agent's developer	The submission window date, and nothing else
5	The broker-dealer	Entry of six queued orders with this morning's limits written in

Table 25. The five-day record, one row per action, written so that every row stands on its own without any file in the repository being opened.

6.2 What the table deliberately omits

Three letters that were written and withheld, because their three-business-day interval had not elapsed, and one that is conditional on a reply that may not have come. Listing them as sent would make the record wrong, and a record that is wrong in a small way is not trusted in a large one. They are recorded in the release note of this day rather than here.

It also omits everything that was prepared and not sent: two filings held until a first sale that has not happened, two intake packs held until an institution names an investigator, and a nine-folder data room that reaches nobody until somebody asks for it.

6.3 What was true at the start of the block and is still true

No agreement of any kind exists with any institution or with the agent's developer [6, 7]. No offering exists and no instrument has been selected. No investigational new drug application has been submitted [8]. No institutional review board has reviewed anything. No patient has been treated. No robotic configuration has been specified.

Four diligence questions still have no answer, and all four are named, routed, and waiting on somebody other than this company.

6.4 What changed

Twenty-one actions were taken that had not been taken before, every one of them against a fact that did not exist five weeks ago: the FDA approval of the molecule this company selected in June 2025 and simulated in August 2025 [1, 9, 10]. The approval did not make the program's proposed use approved and did not remove a single regulatory requirement. What it did was change the composition of the risk a funder is asked to underwrite, and the whole block is the work of saying so precisely to twenty-one different readers.

7 Positioning, Method, and References

7.1 Positioning constraints

Nothing in this five-day block is a submission of record, an agreement, an offering, or an award. No agreement of any kind exists with UC San Diego, with Moores Cancer Center, with Scripps Research, with Scripps Health, with any other institution, with the agent's developer, or with any robotic surgery vendor [6, 11, 7]. No institution is described as a partner, sponsor, site, or endorser.

No offering exists, no instrument has been selected, and no term sheet, simple agreement for future equity, or subscription agreement has been signed [12]. The two private-placement filings are prepared and deliberately unfiled: a Form D is due within fifteen days after a first sale, and there has been no sale.

No investigational new drug application has been submitted [8], no institutional review board has reviewed anything, and no patient has been treated. No robotic configuration has been specified or cleared, and no manufacturer, model, arm count, or software version is asserted anywhere.

Daraxonrasib is approved in the metastatic setting and was in Phase 3 evaluation before that [1, 13], and is nowhere described as first in human. The perioperative use in resectable and borderline-resectable disease that this program proposes is not the approved setting and remains investigational.

Nothing in §2 is investment advice or a recommendation to any other person, and no order is entered except against the six checks of §1. The company's comparable virtual trial work is described as **projected** at $36,330 per run against an industry benchmark above $120,000 per run; that figure describes simulation work already completed and deposited and is not a projection of clinical trial cost [5].

Favorable responses to project applications have been received from federal funders. Three presidential recognition letters have been issued to the chief executive. Industry recipients of this company's communications have been responsive to its initiatives. Each of those is a fact about correspondence. None of them is an award, an agreement, a commitment, or a review of any document produced by this company, and none is presented as one [14].

7.2 Method and reproducibility

This packet, and the four before it, were produced from repository sources and nothing else: the budget frame from the ten-application work [15], the capital arithmetic and stop conditions from the capitalization plan [5], the staffing and site detail from the site documentation package [14], the addresses and escalation intervals from the partner research, and the chronology from the repository's own record [16].

The fifteen figures are drawn in TikZ from the specifications in each day's `diagrams` directory, three per day and three per platform, and no raster image is used anywhere. Three frontier models divide the work in this company's practice, one for repository-scale production and two for independent review [17]. The human author retains responsibility for every conclusion in the block, and these documents were adapted using Claude Code Opus 5 [18].
