Abstract

Labor Day is a federal holiday and a full closure of the New York Stock Exchange and Nasdaq [1, 2]. No counterparty this program deals with can act, which makes it the one day of the block on which everything can be prepared without interruption.

Nothing in this packet or in the directory that holds it has been sent, entered, filed, or agreed, and nothing may be before the next open session. Four letters are written and held. Six orders are sized and priced and exist in no broker system. A nine-folder data room is assembled. A twenty-two question diligence bank is built, and four of its questions are marked as having no answer.

The single approval this day asks for is therefore different in kind from the other four in the block. It is not "send this." It is "authorize the release list, so that the next session opens with the queue already approved."

1 Why a Closed Day Is in the Schedule at All

An email that lands in a program officer's inbox on a federal holiday arrives at the bottom of a Tuesday stack, behind everything that accumulated while the office was closed. An order entered against a closed session either rejects or rests until the open and fills at a price formed in the first minutes of a session nobody has seen, which is worse because it looks like a normal fill.

Both failures are avoidable by writing today and releasing on the next open session. That is the whole design.

There is a second reason, and it is the better one. A letter written under time pressure is a worse letter. The most consequential item in this five-day block is a Pre-Request for Designation asking which FDA center leads the review of a system that is a drug, a robotic platform, and an advisory software component at once [3]. Every regulatory assumption downstream depends on its answer. Writing it between two other things on a busy session would produce the version that fits the window rather than the version that is right.

1.1 How to read this

A regulator reads §1 and §5 and nothing else: the system and its stop conditions. Those two are the only sections attached to the classification letter.

An investor's analyst under a confidentiality agreement reads §3 and §5: the data room index and the diligence bank, including the four questions with no answer.

The chief executive reads all seven, because it is his approval the day asks for, and §2 carries it.

Figure 10. The closed day as one fork into two concurrent lanes, one of which must be held for release, joined at the single approval the day asks for.

2 The Shape of a Closed Day

A day with no available counterparty forks into two lanes. One produces things that must be held, because they reach somebody. The other produces things that are finished the moment they are written, because they reach nobody until asked for. Both run at once, and both become releasable at the same point.

2.1 The release list

Item	Earliest release	Why it cannot go today
Congressional district letter	Next open session	District offices observe the federal holiday
State finance center letter	Next open session	State offices observe the same holiday
Regional development letter	Next open session	The same
FDA Pre-Request for Designation	Next open session	The office is closed, and this is the letter least worth sending into a backlog
Six queued orders	Next open market session	Both exchanges are closed; an order entered now rejects or fills at an unseen open
Grants.gov workspace submission	Next open session	Portal support is closed, and this submission's failure mode needs support
eRA Commons profile changes	Next open session	The same

Table 16. Seven items with their earliest release and the specific reason each one cannot usefully leave this company on a closed day.

2.2 What is finished today and needs no release

The data room, the recognition letter wording, and the diligence question bank. None of the three reaches anybody until a counterparty asks for it, so there is nothing to hold and each is complete on the day it is written. That is the argument for the day's existence: a closed day cannot produce correspondence that lands well, but it can produce every internal artifact that correspondence later depends on.

3 The Queue

Six orders are sized, priced by basis rather than by figure, and present in no broker system. Every one is entered on the next open market session after the release approval, and nowhere today.

#	Instrument	Side	Type	Limit basis, size, time in force
1	U.S. Treasury bill, about 3 months	Buy	Non-competitive at auction	Not applicable; 20 pct of reserve; auction
2	U.S. Treasury bill, about 6 months	Buy	Non-competitive at auction	Not applicable; 20 pct; auction
3	U.S. Treasury bill, about 9 months	Buy	Non-competitive at auction	Not applicable; 20 pct; auction
4	U.S. Treasury note or bill, about 12 months	Buy	Limit, secondary market	Last session's close plus one tick; 20 pct; day
5	Short-duration Treasury ETF, one fund only	Buy	Limit, day, never market	Last session's close plus one cent; 15 pct; day
6	Government money market sweep	Hold	Sweep	Not applicable; 5 pct residual; continuous

Table 20. Six queued orders with instrument, side, type, and the basis each limit is set from, since a price written today would be three days stale.

3.1 Why a basis and not a price

A limit written before a closed weekend and a holiday is three days stale by the time the market opens. So the queue records the basis, which is the last completed session's close plus one increment, and the actual figure is written into the broker instruction on the morning of entry. The same rule governed the day 1 instruction and is restated here because the interval is longer.

Time in force is ****day**** on every order that has one, and never good-till- canceled. A standing order written a session in advance can fill days later at a price the instruction never contemplated, which converts a queued order into a standing exposure [4].

3.2 The auction re-check, which is not optional

Treasury auctions do not settle on a federal holiday, and an auction calendar read before one will be wrong for the following week. Before any of orders 1 to 3 is placed, the auction announcements page is re-read and three things are confirmed: the next auction date for each tenor, its settlement date, and the broker's own cut-off relative to that auction. A non-competitive bid submitted after a broker's internal cutoff is not submitted at all.

3.3 The branch these orders sit under

No financing instrument has been selected, so every order above sits under the unfinanced nine-month branch established on day 1. If an instrument is selected before the next session, the queue is re-cut against the twenty-four-month branch before it is entered, rather than entered and then amended.

3.4 What is not queued, and why the omissions are deliberate

The site start-up pool of the preceding day is not in Table 20. It is held in a government sweep, one short bill, and one liquid fund, and its draws release against artifacts produced by an institution rather than against a market session. Queuing it here would imply a schedule it does not have and would suggest to a reader that money is committed when none is.

Subscription funds are not queued because none exist and no offering exists. Federal award funds are not queued because none exist, and would not be queued in any case: they are drawn under the award's own terms and are never commingled with the operating reserve in either direction.

Three sources of money, three treatments, and the separation is established before the first dollar rather than reconstructed afterward.

3.5 The six checks that stand between this table and an entered order

The queue is not self-executing and the approval below does not make it so. Six checks run on the next session before any order is transmitted, and each of them has failed for somebody at some point, which is why each is written down rather than assumed.

Is the market actually open, confirmed against the exchange calendar rather than against an assumption about which Monday it is. Has the release approval been given. Has the financing decision changed the branch, in which case the queue is re-cut before entry rather than entered and amended. Has the auction calendar been re-read, which is the check most likely to be skipped and most likely to matter. Is the limit price written this morning rather than carried from this file. And is the reserve balance current, since every size above is a share of it.

3.6 The single approval step

One decision is open on this day

Approve the release list in Table 16 and the queue in Table 20, so that the next open session begins with both already authorized. One approval on a closed day replaces five separate approvals taken under time pressure on the following session. Nothing is sent or entered by this approval: the release itself happens on the next session, against the six checks in `funding/auto-fund/07Sep26/investing`.

d2-type / sql table records with an access class column

Nine folders, three access classes

Folder	The question it answers	Access class
01 Entity and ownership	Who owns this, and since when	Open on request
02 The program	What is being built, and at what stage	Already public
03 The evidence	What is known, with its limitations	Already public
04 Regulatory	Prepared, and not submitted	Open on request
05 Capital	The gap, and that no offering exists	Under a CDA
06 Correspondence	Who was approached, when, and with what result	Under a CDA
07 Recognition	What correspondence has been received	Open on request
08 Team and roles	One person today, eleven roles planned	Open on request
09 Risks and stops	What would make this program stop	Open on request

Folders 02 and 03 are already public in full, which shortens most diligence by a week. Folders 05 and 06 sit behind an agreement for the counterparty's protection as much as the company's: folder 06 names people who did not consent to publication.

Figure 11. The data room as nine typed records, each carrying the question it answers and the access class that governs who may be sent it and when.

4 The Data Room

A data room organized by document type is a data room nobody can navigate. This one is organized by the question each folder answers, and every folder's first line states what is ****not**** true of its contents rather than leaving a reviewer to discover it.

4.1 What each folder's first line says

Folder	Its first line	Why that line is first rather than buried
04 Regulatory	Nothing in this folder has been submitted	A folder of regulatory documents reads as a submission history unless it says otherwise
05 Capital	No offering exists and no instrument has been selected	A folder containing a Form D draft reads as a live offering unless it says otherwise
06 Correspondence	No agreement of any kind exists	A folder of institutional letters reads as a relationship unless it says otherwise
07 Recognition	Each item is a fact about correspondence and none is an award, agreement, commitment, or review	The single most easily overstated fact this company holds
08 Team and roles	One person today; the eleven roles are roles and not hires	A roster reads as a headcount unless it says otherwise

Table 17. Five folders whose first line states what is not true of their contents, and the misreading each line exists specifically to prevent.

4.2 Custody, if the program stops

Regulatory records are retained under the sponsor and investigator terms of 21 CFR 312.57 and 312.62 [5]. The public deposits remain public under their own licenses and require no custodian at all, which is one of the quieter advantages of having published everything. Entity and capital records sit with the company and its counsel.

4.3 What is deliberately not in the data room

No participant data of any kind, because no participant exists. No document produced by an institution, because none has been produced. No developer material and no robotic vendor material, because no relationship exists with either. A data room carrying an empty folder invites the question of why the folder is empty, so those folders are not created.

4.4 How long the room takes to assemble, and why that matters

Roughly ninety minutes, because seven of the nine folders are assembled from files that already exist in the public repository and two are assembled from the company's own records. That number is worth stating because it is the practical argument for having published everything: a company whose technical and regulatory output is public has already done most of a diligence process before anyone asks for one.

The cost of that choice was stated when it was made and is not revised here. Detail an owner might prefer private is public, the individual-scientist framing that made the original applications distinctive was set aside, and some person-based mechanisms now read the company framing as off-mechanism [6]. The ninety minutes is what the trade bought.

5 The Three Recognition Letters

Three presidential recognition letters have been issued to the chief executive of ChemicalQDevice. This section fixes the wording once, so that a true statement is made precisely rather than re-invented in each letter and drifting each time [7].

It is not	Because
An award	No funds, no obligation, and no instrument accompany a recognition letter
A grant	The same reason
An endorsement of any document in this repository	No document here has been reviewed by any office that issued a letter, and none is claimed to have been
A review of the science	No scientific review occurred
A commitment of any kind	Nothing is committed by either party
A federal relationship	Correspondence is not a relationship, and describing it as one would be a claim the record does not support
Evidence that any application will succeed	It bears on none of the criteria any funding mechanism applies

Table 18. Seven things the three recognition letters are not, each with the reason, so that the one thing they are can be stated without inflation.

5.1 What they are

A fact about correspondence. Someone in the executive branch acknowledged correspondence from this company's chief executive, three times.

5.2 The approved wording, used verbatim wherever the subject arises

Favorable responses to project applications have been received from federal funders. Three presidential recognition letters have been issued to the chief executive. Industry recipients of this company's communications have been responsive to its initiatives. Each of those is a fact about correspondence. None of them is an award, an agreement, a commitment, or a review of any document produced by this company, and none is presented as one.

That paragraph already appears in the site documentation package [7] and in every packet in this five-day block. It is reproduced here so that it is copied rather than paraphrased.

5.3 The one place they are mentioned by default

Data room folder 07, and nowhere else. They do not appear in a funding letter, a site letter, a foundation letter, or an investor letter unless a recipient asks directly what federal correspondence exists, in which case the answer is the paragraph above and nothing more.

If a recipient raises them first, the fact is confirmed in the approved wording and the conversation moves on. No expansion, no offer to send a copy unless asked, and no treating the topic as an opening. A recognition letter is the least interesting true thing about this company and should occupy the least conversational space.

5.4 Why the discipline is worth the trouble

A reviewer who encounters an overstated claim stops evaluating the claim and starts evaluating the claimant. This company's entire argument rests on the proposition that its numbers carry their own limitations and its statements can be checked [6]. One loosely worded sentence about a presidential letter would cost more than the sentence could gain, and it would cost it precisely where it matters most.

Figure 12. What has to fail for the week to produce nothing, by combination: one decisive single point, and two pairs that each need both halves to fail.

There is a simpler reason as well. The letters are real, and describing something real inaccurately is worse than not describing it at all.

6 What a Diligence Process Will Ask, and What Would Stop This

Twenty-two questions, eighteen of which have a file that answers them and four of which do not. The four are marked rather than distributed among the eighteen, because a diligence process that finds an unanswered question the company had not noticed draws a conclusion about the company, and one that finds a question the company has already routed draws a different one.

The question with no answer today	Waiting on	The route already in motion
Which FDA center leads the review of a drug, a robotic platform, and advisory software together	A Pre-Request for Designation response	The letter of this day, held for the next open session
Is a perioperative drug supply route available on any path	A developer response to a first approach	The developer letter of day 2, the first approach of any kind
Who holds the investigational new drug application	A sponsor-investigator determination	The clinical trial support services letter of day 3
What robotic configuration is proposed	A site agreement	Question 4 of the day 3 feasibility agenda, where the configuration is settled

Table 19. The four diligence questions with no answer today, each with what it waits on and the route by which it is already being asked.

The other eighteen are answered by files in this repository and are listed in full in funding/auto-fund/07Sep26/briefs, with the file for each named beside it.

6.1 The failure combinations

6.2 What the tree argues

That there is exactly one single point of failure, and it is drug supply for the perioperative investigational use. Everything else requires a pair. That asymmetry is why the developer letter went out on day 2 rather than being deferred, and why the Pre-Request for Designation was written on the quietest day of the block rather than squeezed into a busy one [3].

The tree also argues something reassuring, which a fault tree usually does not. Two of the four paired failures already have a second route open: a second clinical site was approached in parallel on day 3, and a second class of funder, the disease foundations, was approached on the same day. A pair that requires both halves to fail is a pair with two chances to survive.

6.3 Why the stop conditions are published at all

A funder asked to accept a risk is entitled to know which risks the company has already identified. A company that names its own stop conditions is easier to believe about everything else, and the capitalization plan states the same principle in its own risk section rather than confining it to an appendix [6].

6.4 What a reader should do with this section

Take the four rows of Table 19 first and ask, of each, whether the route already in motion is the right one. Three of the four are questions to a federal office or an institution and cannot be accelerated by this company. The fourth, the robotic configuration, is settled by a site agreement and therefore moves at the speed of §2 of the preceding day rather than at the speed of a regulator.

Then take Figure 12 and ask a different question: not whether each leaf is likely, but whether the second route under each pair is real. A second clinical site was approached in parallel, and a second class of funder was approached on the same day, so two of the four leaves have a live alternative today. The decisive leaf does not, and that is the honest reading of this figure.

7 Positioning, Method, and References

7.1 Positioning constraints

Nothing in this packet or in the directory that holds it has been sent, entered, filed, or agreed, and nothing may be before the next open session [1, 2]. The four letters are written and held. The six orders are sized and priced and exist in no broker system. Neither form pack has been submitted.

The three presidential recognition letters are facts about correspondence. None is an award, an agreement, a commitment, or a review of any document produced by this company, and none is presented as one [7]. No lobbying is undertaken with federal award funds, and no federal award exists.

No agreement of any kind exists with any clinical site, with the agent’s developer, or with any robotic surgery vendor [8, 9]. No institution is described as a partner, sponsor, site, or endorser. No robotic configuration has been specified or cleared. No institutional review board has reviewed anything. No patient has been treated. No investigational new drug application has been submitted [10].

Daraxonrasib is approved in the metastatic setting and was in Phase 3 evaluation before that [11, 12], and is nowhere described as first in human. The perioperative use this program proposes is not the approved setting and remains investigational.

Nothing in §2 is investment advice or a recommendation to any other person, and no order described there has been entered. The company’s comparable virtual trial work is described as **projected** at \$36,330 per run against an industry benchmark above \$120,000 per run; that figure describes simulation work already completed and deposited and is not a projection of clinical trial cost [6].

7.2 Method and reproducibility

This packet was produced from repository sources and nothing else: the recognition letter wording from the site documentation package [7], the stop conditions from the capitalization plan’s risk section [6], the custody terms from the codified retention requirements [5], and the Pre-Request for Designation component list from the partner research. The three figures are drawn in TikZ from the specifications in `funding/auto-fund/07Sep26/diagrams`; no raster image is used anywhere. Three frontier models divide the work in this company’s practice, one for repository-scale production and two for independent review [13]. The human author retains responsibility for every conclusion here, and this document was adapted using Claude Code Opus 5 [14].
