

The External Standard Request

An SEC regional office has written that it is taking the company's request "very seriously." This packet answers with the dated record, routes the clinical question to the FDA's oncology AI program, and says plainly what the record does not yet show.

Abstract

The chief executive of ChemicalQDevice asked the SEC San Francisco Regional Office that the company's oncology clinical trial research be listed as an external standard for substantial oncology clinical trial research, on the basis that the company's LLM papers have been used extensively by OpenAI and Anthropic. The office has written that it is taking the request "very seriously" [1]. This packet answers that update.

It answers with a record rather than an argument. Since June 2025 the company has deposited eleven works on one program with persistent identifiers, built around daraxonrasib independently of its developer and

simultaneously with the developer's Phase 1/2 and Phase 3 trials, before and after the FDA approved the molecule on August 26, 2026 as Rasonque [2, 3, 4]. The packet lists every identifier with its date, sets the developer's trial calendar beside the company's, and scores the record against eight criteria any external standard would have to meet. Three are met, three are met in part, and two are not yet met; each of the five gaps has a named next action.

Five letters go out today. One answers the SEC office, one asks the FDA's Oncology AI Program which federal venue owns the clinical question [5], and three tell OpenAI, Anthropic and Revolution Medicines that the request names or concerns them, before they hear it anywhere else.

How to read this

A reader with five minutes takes §1, the update and the record, and §2, the action register with the state of the request drawn as a machine with guards.

A reader weighing the request takes §3, which sets the developer's trials and the company's papers on one calendar, and §4, which scores the record against the eight criteria and shows which part of the record carries each one.

A funder takes §5, the six checkable quantities and the robotic Phase 1 they support. §6 carries the positioning constraints, the method, and the references, every one of which is a clickable link.

1 The Update, and the Record Behind the Request

1.1 What the office said, and what it did not

The SEC San Francisco Regional Office wrote to the chief executive that it is taking his request "very seriously." Those two words are the whole of what this packet attributes to the office. The office has not said it has reached a view, that it has authority to list a clinical research standard, or that any paper is endorsed, listed, or approved, and nothing here suggests otherwise [1]. A regulator's courtesy that is later described as a finding is the fastest way to lose the regulator's attention.

The request itself is stated the same way everywhere it appears: that ChemicalQDevice's oncology clinical trial research be listed as an external standard for substantial oncology clinical trial research, because the company's LLM papers have been used extensively by OpenAI and Anthropic. The second half of that sentence is the company's own statement. §4 sets out what the company can document behind it and what it cannot.

1.2 The standing fact

On August 26, 2026 the FDA approved Rasonque (daraxonrasib), Revolution Medicines' RAS(ON) multi-selective inhibitor, as a first-in-class targeted therapy for metastatic pancreatic adenocarcinoma after prior systemic therapy [2, 6, 7]. The approval rests on the Phase 3 RASolute 302 trial [4, 8], which followed the developer's Phase 1/2 program, registered as the Phase 1/1b study of RMC-6236 [3]. ChemicalQDevice's AI papers on the molecule were developed independently of that program and simultaneously with it, and every one of them is deposited with a date [9].

1.3 The record

Table 6 lists the eleven identifiers on this program in the order they were deposited. Each resolves at the DOI resolver, so the office can check every row without relying on anything the company says about it.

Rows 1 and 2 predate the developer's Phase 3 readout by eleven and nine months [10, 11]. Rows 3 to 8 were deposited after the readout and before the approval [12, 13, 14, 15, 16, 17]. Rows 9 to 11 bracket the approval [18, 19, 20]. That ordering is the substance of the word "simultaneously" in the request: the company's work was done while the developer's trials were running, not after their results were known.

No	Deposited	Work	Identifier
1	June 2025	Daraxonrasib identified across forty meta-analyses	10.5281/zenodo.15735068
2	August 2025	QSP simulation, 12.8 against 5.4 months	10.5281/zenodo.17001137
3	June 2026	Phase 1 protocol, robotic Whipple	10.5281/zenodo.20780121
4	June 2026	Phase 2 randomized protocol	10.5281/zenodo.20807027
5	June 2026	Phase 1 document guidance	10.5281/zenodo.21018646
6	July 2026	Investigational new drug application	10.5281/zenodo.21097442
7	July 2026	Clinical trial funding application	10.5281/zenodo.21232965
8	July 2026	Funding application, version 2.0	10.5281/zenodo.21317266
9	August 2026	Ten applications with a summary paper	10.5281/zenodo.21787424
10	August 2026	Small-business capitalization plan	10.5281/zenodo.21887807
11	September 2026	La Jolla trial site documentation	10.5281/zenodo.22216519

Table 6. The eleven deposited works on this program in the order they were made, each with a persistent identifier the office can resolve without relying on the company.

1.4 Why the record carries the request

A request to be treated as a standard stands or falls on whether a reviewer can check it. An argument about the quality of the work would invite a debate the office is not equipped to hold and has not asked for. A dated list of persistent identifiers invites a check, and a check is something any office can do in an after-noon. The reply the chief executive sends today is therefore built around Table 6, and every other claim in it is framed as a question about venue rather than as a claim about merit.

2 The Action Register

Table 7 lists the day's seven actions in the order they are done. The order is not arbitrary. The SEC office hears from the company before anyone else hears about the request, and the company adopts its own trading rule before it writes to a public company's investor relations office.

No	Action	File	Waits on
1	Reply to the SEC office with the record	email-01	Nothing
2	Ask the FDA which venue applies	email-02	Row 1 sent
3	Notify Anthropic, copying the office	email-03	Row 1 sent
4	Notify OpenAI, copying the office	email-04	Row 3, the same day
5	Adopt the trading and disclosure rules	capital-02	Nothing
6	Notify Revolution Medicines	email-05	Rows 1 and 5
7	Prepare and hold EDGAR access	form-01	A first filing

Table 7. The day's seven actions in the order they are done, with the file that carries each and what it waits on; the trading rule is adopted before the sixth row is sent.

2.1 The request as a state machine

A request to a regulator moves through states the company does not control, and it is easy to describe a state as further along than it is. Figure 4 draws the states, marks the one the request is in today, and writes on each transition the condition that moves it. Only two of those conditions are in the company's hands: supplying the record, and correcting it if a named company asks.

Figure 4. The request as a state machine, with today's state filled, the guard on each transition written in brackets, and the three outcomes that only the office decides.

2.2 Who each letter reaches, and why

The reply to the office copies the Los Angeles Regional Office, whose region includes San Diego, and the Office of the Advocate for Small Business Capital Formation, because the request comes from a small business with a capital formation question behind it [21, 22]. The routing letter to the FDA's Oncology AI Program copies the Oncology Center of Excellence and the Office of Combination Products, because the program behind the question would, if it ever reached a submission, be a combination of a drug, a robotic device and advisory software [5, 23, 24].

Row 7 is readiness, not a filing. The company prepared, and left unfiled, a Form D for a private offering in the first block of funding actions; a Form D is due within fifteen days after a first sale, and EDGAR access must exist before then [25, 26]. An office that is taking a request from this company seriously should never find the company unable to file on time.

2.3 What the three notices are for

Letters 3, 4 and 5 ask for nothing. They exist because a company that names third parties in a request to a federal office tells them first. OpenAI and Anthropic are each told what the company's own repository records about their tools, and each is invited to correct the request's description of them, with the correction copied to the office the same day [27, 28]. Revolution Medicines is told that independent research on its molecule is referenced, that no relationship of any kind exists, and that the request concerns nothing about the company or its securities [7]. The SEC is deliberately not copied on that letter.

The one approval this day asks for

Approve answering the SEC office with the full dated record, routing the clinical-standard question to the FDA's Oncology AI Program, and notifying the three companies the request names or concerns. Adopt the trading and disclosure rules before the notice to Revolution Medicines is sent.

3 Independence and Simultaneity

Two words in the request carry most of its weight. *Independently* means the company had no relationship with Revolution Medicines, no access to its data, and no right of reference to its filings; every input to the company's work was public. *Simultaneously* means the work was done while the developer's trials were running, not after their results were known. Both are claims about time, and both can be checked against public registries. Table 8 sets the two calendars side by side.

Figure 5. The developer’s three trials and the company’s deposits on one time axis, with the company’s first two papers inside the Phase 3 enrollment window.

Period	Revolution Medicines, public record	ChemicalQDevice, deposited record
2022 to 2024	Phase 1/1b opens; RASolute 302 opens	No work on the molecule
June 2025	RASolute 302 enrolling	Identification across forty meta-analyses
August 2025	RASolute 302 enrolling	QSP simulation, 12.8 against 5.4 months
December 2025	RASolute 304, adjuvant Phase 3, opens	Physical AI work follows in 2026
May to July 2026	Readout: 13.2 against 6.6 months	Protocols, IND and funding applications
August 26, 2026	FDA approval as Rasonque	Ten applications, capitalization plan
September 2026	RASolute 304 enrolling	Site package and these funding actions

Table 8. The developer’s trial calendar and the company’s deposit calendar on one set of rows, showing work begun while the Phase 3 trial was still enrolling patients.

The developer’s rows come from the public registries and the published readout [3, 4, 29, 8]. The company’s rows come from its own deposit dates [10, 11, 12, 15, 20]. Nothing in either column depends on the other. Figure 5 draws the same two calendars as a gantt chart, so the overlap can be seen rather than read.

3.1 What the overlap shows, and what it does not

The overlap shows that the company chose the molecule and simulated its effect while the Phase 3 trial was enrolling, and published both before the trial reported. It does not show that the simulation predicted the trial. The simulation modeled 1000 patients on a combination in a KRAS G12C population; the trial enrolled 241 patients in the relevant comparison on a single agent in a primarily G12D and G12V population. The two survival figures, 12.8 and 13.2 months, are close, and the company describes that closeness as a dated chronology and never as a validation [11, 8].

It also does not show that the developer knew of the company’s work or relied on it. There is no evidence either way, and the company claims none. Independence runs in both directions: the company did not use the developer’s data, and it does not suggest the developer used its papers.

4 What an External Standard Requires

A request to be listed as an external standard invites one question before any other: a standard by what measure? This section proposes eight criteria that any body of work would have to meet before a reviewer could reference it as a benchmark for oncology clinical trial research, and scores the company’s record against

d2-type / grid with shaded status cells

Where each criterion is carried

Criterion	2025 papers	Protocols and IND	Applications and plans	Repository and builds	Outside replies
1. Persistent identifiers	Carries the criterion	Carries the criterion	Carries the criterion	Carries it in part	Does not carry it yet
2. Dated versions	Carries the criterion	Carries the criterion	Carries the criterion	Carries it in part	Does not carry it yet
3. Open method	Carries the criterion	Carries it in part	Carries it in part	Carries it in part	Does not carry it yet
4. Credibility assessment	Carries the criterion	Does not carry it yet	Does not carry it yet	Carries it in part	Does not carry it yet
5. Regulatory mapping	Does not carry it yet	Carries it in part	Carries it in part	Carries it in part	Does not carry it yet
6. Independent review	Carries it in part	Carries it in part	Carries it in part	Carries it in part	Does not carry it yet
7. Outcome validation	Carries it in part	Does not carry it yet	Does not carry it yet	Does not carry it yet	Does not carry it yet
8. Adoption, confirmed	Does not carry it yet	Does not carry it yet	Does not carry it yet	Does not carry it yet	Does not carry it yet

Carries the criterion
 Carries it in part
 Does not carry it yet

Figure 6. The eight criteria against five parts of the record, shaded by whether each part carries the criterion fully, in part, or not yet; the last two rows are open.

each. The criteria draw on the ASME approach to computational model credibility [30], the ICH principles for model-informed drug development [31], and the FDA’s draft guidance on artificial intelligence in regulatory decision-making [32].

Three of the eight are met across the record: persistent identifiers, dated versions, and an open method. The other five are met in part or not yet, and each is taken in turn below before Table 9 summarizes all eight.

4.1 Where each criterion is carried

Before the criteria are taken one by one, Figure 6 shows where in the record each is carried. It breaks the record into five parts and shades each cell by whether that part carries the criterion fully, in part, or not at all. Two things stand out. The first three criteria are carried across the whole record. The last two are carried only by replies the company does not yet have.

4.2 The five criteria not yet fully met

Credibility assessment. The score of 81.9 over 55 tests is a pre-trial credibility score for the digital twin, not a post-trial validation, and it covers the model rather than the trial documents [33]. Extending the same test battery to the Phase 1 protocol’s decision rules is the next step.

Regulatory mapping. The investigational new drug application and both protocols are mapped to 21 CFR Part 312 and adapted ICH guidance [15, 34]. No regulator has reviewed the mapping, and the routing letter to the FDA program asks where such a review would belong.

Independent review. Each document is produced by one model and reviewed by two others from different developers [27]. A clinical investigator’s written review of the Phase 1 protocol, published with consent, would add the human reviewer a standard needs.

Outcome validation. The only comparison between a company prediction and a trial result is a chronology. A prospective test means publishing a dated prediction for one endpoint of a trial that has not yet reported, and being scored on it afterward.

Adoption. The company can document its own use of OpenAI and Anthropic tools. It cannot document either company's internal use of its papers, and it has written to both inviting a correction. Until either replies, the criterion is unmet on independent evidence, and the company says so.

4.3 The eight criteria together

No	Criterion	What the record holds today	Status
1	Persistent identifiers	Eleven DOIs across the program	Met
2	Dated versions	Deposit dates; releases v4.0.0 to v4.9.0	Met
3	Open method	Public source, prompts and build records	Met
4	Credibility assessment	VVUQ score 81.9 over 55 tests, pre-trial	In part
5	Regulatory mapping	21 CFR 312 and ICH mapping, unreviewed	In part
6	Independent review	Two model reviewers; no human reviewer	In part
7	Outcome validation	One chronology; no prospective test	Not yet
8	Adoption, confirmed	The company's statement, unconfirmed	Not yet

Table 9. Eight criteria for an external standard scored against the record as it stands today: three are met, three are met in part, and two are not yet met.

A table that scored every criterion as met would be read as advocacy. This one says two are not yet met, and the subsection above names the action that would change each of the five that fall short. That is what makes it a record rather than a pitch.

5 The Evidence Behind the Robotic Phase 1

The request to the SEC office concerns the company's research as a body of work. A funder reading this packet has a narrower question: what trial would the money run, and what evidence says it is worth running? This section answers with six quantities a reviewer can check, each beside the limitation its own authors stated, and with the design numbers fixed in the deposited protocol.

Source	Test arm	Comparator	Tier	Stated limitation
RASolute 302, 2026	13.2 mo mOS	6.6 mo mOS	Trial	Metastatic setting only
QSP model, 250 ODEs	12.8 mo, HR 0.25	5.4 mo mOS	In silico	No resistance modeled
Twin, 1000 patients	12.1 mo mOS	No comparator	Twin	Simple Emax model
Twin, PFS	HR 0.31	No comparator	Twin	No immune compartments
VVUQ, 55 tests	Score 81.9	V and V 40 gate	Twin	Pre-trial score only
Empirical triplicate	G3+ 8.0 pct	G3+ 25.0 pct	In silico	Two logs disagree

Table 10. Six quantities that a reviewer can check against a published or deposited source, each set beside its comparator; its evidence tier; and its stated limitation.

Only the first row is a clinical result, and it is the developer's, in the metastatic setting [8]. The other five are the company's own in silico and digital twin work [11, 33]. No row is presented without its limitation, and none is presented as evidence for the perioperative use this program proposes. What the six do establish is that the agent choice was made on a dated, quantitative record, and that the one clinical readout since has landed near the company's simulation.

5.1 The trial the evidence supports

The deposited Phase 1 protocol is open-label, single-arm, 3+3 dose escalation of perioperative daraxonrasib at 160, 220 and 300 mg, with a 28-day dose-limiting toxicity window, in up to 18 treated participants with resectable or borderline-resectable KRAS-mutated pancreatic ductal adenocarcinoma [12]. The procedure

is a staged eight-arm robotic pancreaticoduodenectomy with 56 degrees of freedom and 640 sensor channels, force limits of 3 N per arm and 18 N cumulative, a 3 ms cross-arm stop against a 500 ms system stop, and a five-vessel no-fly gate. An on-premises language model is confined to advisory output, with no write credential to data capture and no route to the robot control network [15].

The disease the trial addresses remains the one with the widest gap between incidence and survival in the United States [35]. The developer's own adjuvant Phase 3 in resected disease is enrolling [29]. The perioperative, robot-assisted question this program asks is a different one from either of the developer's Phase 3 trials, and it is the question a Phase 1 is designed to open.

5.2 The money frame

The program's direct cost is \$700,000 a year for five years, \$3,500,000 in total. An SBIR route of \$306,000 in Phase I and \$1,300,000 in Phase II totals \$1,606,000, leaving a delta of \$2,104,000 that the capitalization plan places against \$5,900,000 of private capital behind a firewall, a leverage of 3.67 to 1 [19, 18]. The company's comparable virtual trial work is **projected** at \$36,330 per run, a figure that describes simulation work already deposited and not the cost of the clinical trial. None of these numbers depends on the SEC request, and none changes with its outcome.

6 Positioning, Method, and References

6.1 Positioning constraints

The SEC San Francisco Regional Office has written that it is taking the company's request "very seriously." That is a statement about a request. It is not a determination, a listing, an endorsement, or a decision, and nothing in this packet describes it as one [1]. The Commission does not set clinical research standards, and the company has said so to the office in writing.

The statement that the company's LLM papers have been used extensively by OpenAI and Anthropic is the company's own, made as the basis of its request. The company can document its own use of the two developers' tools; it cannot document either developer's internal use of its papers. No agreement, sponsorship, investment, or endorsement of any kind exists with either company, and each has been invited to correct the statement [27].

No agreement, supply arrangement, or right of reference of any kind exists with Revolution Medicines, and the company holds no nonpublic information about it. Rasonque is approved for metastatic pancreatic adenocarcinoma after prior systemic therapy [2]; the perioperative use this program proposes remains investigational. No investigational new drug application has been submitted [34], and no patient has been treated. The company has no public securities and no offering underway, and nothing in the day's capital instruction is investment advice.

6.2 Method and reproducibility

This packet was produced from repository sources and from the public pages of the offices it writes to: the record from the repository's release list and the deposited works themselves; the developer's calendar from the public trial registries and the published readout [3, 4, 29, 8]; the six quantities from the capitalization plan [19]; the model roles from the repository's published division of work [27]; and the daily format from the first block of funding actions [36]. Every recipient address was checked against the page its office publishes.

The three figures are drawn in TikZ from the specifications in the day's `diagrams` directory, one each in the PlantUML, Mermaid and D2 vocabularies, and no raster image is used anywhere. The human author retains responsibility for every conclusion, and this document was adapted using Claude Code Opus 5.5 [37].
