Abstract

[DRAFTING INSTRUCTION] *full-apply writes a 1,600 to 1,900 character abstract from funding/pdac-funding-applications/applications/README.md \$1 and \$2, funding/science-golden-age/chunk-01-front-matter-and-summary.md for the policy sentence, and funding/daraxonrasib-llm-story.md for the clinical numbers. It must state the count (ten), the split (five surgical, five medical oncology), the mechanism basis (\$200 billion realignment toward the individual scientist), the partner of choice (UC San Diego Moores Cancer Center, feasibility stage only), and the fact that PART I carries no DOIs.*

How to Read This Paper

[DRAFTING INSTRUCTION] *full-apply writes three short paragraphs: (a) what the paper is, a summary of ten application file sets rather than an application itself; (b) what it is not, namely medical or regulatory advice, and not a claim that any institution has agreed to anything; (c) the reading order for three audiences, a funder, a clinician, and a metascience reader, each pointed at two sections.*

Figure and Table Inventory

[DRAFTING INSTRUCTION] *full-apply builds this as one full-width table with four columns: figure number, type, section, and the question it answers. Source the twenty rows from the five stage READMEs at funding/pdac-funding-applications/mermaid/README.md, .../plantuml/README.md, .../d2/README.md, .../diagrams-python/README.md, and .../graphviz/README.md. The type split is 6 mermaid, 3 plantuml, 4 d2, 3 diagrams-python, 4 graphviz, and the README must state that the split follows purpose rather than quota.*

[DRAFTING INSTRUCTION] *full-apply adds a second, shorter table listing the paper's tables by number, section, and source directory. Tables draw from funding/RFA-RM-27-001-v2/, funding/supplementary/source-files/, and funding/pdac-funding-applications/applications/.*

1 The \$200 Billion Realignment and the Individual Scientist

[DRAFTING INSTRUCTION] *full-apply writes 5,500 to 6,500 characters here from funding/science-golden-age/chunk-01-front-matter-and-summary.md (the four transmittal-letter goals, the individual-scientist sentence, the Pioneer Award naming) and funding/science-golden-age/chunk-03-chapter-two-revitalizing-science-and-technology-enterprise.md (the \$200 billion portfolio, the incumbency tax, 270 added requirements since 1991, indirect rates of 50 to 60 percent, grant lead times up to 20 months, mid-scale science, HHMI-style person funding, fast grants, golden tickets). Quote the report only where alignment is the point; cite the underlying end note via chunk-07 and the BibTeX keys in chunk-09 and chunk-10 wherever a quantitative claim has a primary source.*

1.1 What the Report Actually Says

[DRAFTING INSTRUCTION] *Three paragraphs. The first states the four goals verbatim. The second gives the \$200 billion finding and the “no systematic framework” sentence. The third states the corrective: realign toward risk taking, strip administrative burden, scale long-horizon individual grants.*

1.2 Where the Enterprise Stalls

[DRAFTING INSTRUCTION] *full-apply builds Table 1 here: a full-width table with columns Finding, Value, Source chunk, and Mechanism that addresses it. Rows: nearly half of research time on paperwork; 270 new federal requirements 1991 to 2025; negotiated indirect rates 50 to 60 percent; grant lead times up to 20 months; NIH PI average age 39 to 51 between 1980 and 2008; Eroom's law roughly eightyfold fall in new drugs per billion dollars since 1950.*

1.3 Why an Independent Scientist Is the Test Case

[DRAFTING INSTRUCTION] *full-apply writes two paragraphs drawing the fourteen-work ledger from funding/supplementary/PhysicalAIOncologyTrialFoundingDocuments.md and the cost comparison from funding/supplementary/source-files/Daraxonrasib-Efficient-LLM-Trial-Simulations.zip. State the productivity claim as a ratio, not as a superlative.*

One sentence of federal policy, three mechanism families, and the ten recipients each family reaches. The split is by mechanism, not by agency, which is why one recipient is not a federal funder.

The five states a proposal from an unaffiliated scientist passes through, and the three at which the report says the enterprise currently stalls. Each stall names the mechanism that removes it.

Ten applications on four attributes. The science column is constant by construction: the same trial is described ten times, and only the mechanism, the term, and the ask change.

2 The Ten Applications

[DRAFTING INSTRUCTION] *full-apply* writes 5,000 to 6,000 characters from `funding/pdac-funding-applications/applications/README.md` \$1, \$2 and \$7, plus each of the ten `applications/app-*/README.md` files for the per-recipient ask and anchor. Do not restate the applications; state what the set as a whole demonstrates.

2.1 Selection Rule

[DRAFTING INSTRUCTION] *One paragraph:* a recipient qualifies only if the report names its program or the mechanism it runs. Give the anchor chunk for each of the ten and state that no recipient was included on plausibility alone.

2.2 What Differs, and What Does Not

[DRAFTING INSTRUCTION] *full-apply* builds Table 2: a full-width table with columns *Number*, *Recipient*, *Mechanism family*, *Term*, *Direct ask*, and *Perspective*. Ten rows. Draw values from the application READMEs; do not recompute them.

[DRAFTING INSTRUCTION] *Then two paragraphs on the deliberate constant:* the trial, the population, the endpoints and the governance are identical across all ten, so a reviewer comparing two of them sees only a mechanism difference.

2.3 Redundancy

[DRAFTING INSTRUCTION] *One paragraph reading the figure:* name the two single-source activities, IND activation and IRB approval, and say why they are funded first in every application that can fund them.

Ten awards against eight trial activities. Six activities have two or more upstream awards and survive any single refusal; the two that do not are drawn heavier, and both are regulatory.

Seven actors and the eleven actions each may take. Every action has at least one human association; the advisory model has exactly one, and the struck links are the four it is denied by construction.

3 Set A: The Surgical Perspective

[DRAFTING INSTRUCTION] *full-apply* writes 6,000 to 7,000 characters from `applications/app-01-nih-pioneer-award/` through `applications/app-05-nih-sbir-seed/`, one subsection per application, each summarising the mechanism fit and the one argument unique to that recipient. Do not repeat the trial description; it is given once in §5.

3.1 What Leads in Set A

[DRAFTING INSTRUCTION] *One paragraph: the operation leads, daraxonrasib enters as the perioperative arm the operation is timed around, and the endpoint table is led by conversion, anastomotic integrity, operative time, blood loss, R0 margin and 90-day morbidity.*

3.2 Applications 01 to 05, One Paragraph Each

[DRAFTING INSTRUCTION] *Five short subsections. 01 Pioneer Award: the unit of risk is the individual and the bet does not survive decomposition into R01 aims. 02 ARPA-H: three gates with numeric kill criteria. 03 NSF TIP X-Labs: five activities that no existing performer type covers. 04 DOE Genesis Mission: the Robotics mission sentence applied to an operating room. 05 NIH SEED SBIR: the product is a site-portable governance package.*

[DRAFTING INSTRUCTION] *full-apply* builds Table 3 here: figure inventory for Set A, listing which of the five diagram types each application used and why, sourced from the Figures section of each `applications/app-0*/README.md`.

The five questions a reviewer asks in order, and the section of the application that answers each. A no at gate 1 or gate 2 ends the review; a no at gates 3 to 5 changes the ask.

One award, four parallel workstreams, one join. The join condition is the site agreement, not the money, which is why nine of the ten asks can be satisfied by any single award rather than by all ten.

4 Set B: The Medical Oncology Perspective

[DRAFTING INSTRUCTION] *full-apply* writes 6,000 to 7,000 characters from `applications/app-06-fnih-amp/` through `applications/app-10-ucsd-moores-engine/`, one subsection per application. Application 10 is different in kind and must be described as such: it is addressed to the partner institution and asks for a feasibility review, not for money.

4.1 What Leads in Set B

[DRAFTING INSTRUCTION] *One paragraph: the drug and the patient selection lead. The endpoint table is led by dose-limiting toxicity and the 3+3 escalation, perioperative pharmacokinetics and pharmacodynamics, pathologic response, ctDNA clearance, and 24-month overall survival. The operation is the instrumented setting rather than the headline.*

[DRAFTING INSTRUCTION] *full-apply* builds Table 4: the four consortium measurements against their timing relative to resection, from `applications/app-06-fnih-amp/sections/sec-04-operation-governance.tex`.

4.2 Applications 06 to 10, One Paragraph Each

[DRAFTING INSTRUCTION] *Five short subsections. 06 FNIH AMP: a pre-competitive question no party owns. 07 HHMI: the programme written as states rather than aims, so every failure transition re-enters it. 08 NCI CTEP: attribution adjudicated before the toxicity window closes. 09 Convergent FRO: three releases, only one of which depends on the trial succeeding. 10 UC San Diego Moores: a feasibility review with three positioning corrections carried from the author's own priority steps.*

4.3 The Two Sets Describe One Operation

[DRAFTING INSTRUCTION] *Two paragraphs stating plainly that Set A and Set B describe the same hybrid procedure and differ only in what they lead with. Cite `applications/README.md` §2.*

Fourteen months of author work against the one external readout. Bar length is elapsed time, not effort, and the two 2025 overlaps are what a single operator could not have run sequentially.

5 Trial Evidence

[DRAFTING INSTRUCTION] *full-apply writes 7,000 to 8,000 characters here, the paper's densest quantitative section, from `funding/daraxonrasib-llm-story.md` (the chronology and the three stated differences), `funding/supplementary/source-files/Daraxonrasib-Efficient-LLM-Trial-Simulations.zip` (every simulation number and every stated limitation), and `funding/RFA-RM-27-001-v2/LaTeXSourceFiles.zip` (the trial synopsis). Every result must appear in the same row as the limitation its authors stated.*

5.1 The Chronology

[DRAFTING INSTRUCTION] *Two paragraphs: June 2025 identification from 40 PDAC meta-analyses; August 2025 QSP at 12.8 against 5.4 months; October 2025 digital twin at credibility 81.9 across 55 tests; May 2026 RASolute 302 at 13.2 against 6.6 months; July 2026 two funding applications five days apart.*

5.2 What the Numbers Are, and What They Are Not

[DRAFTING INSTRUCTION] *full-apply builds Table 5: columns Source, Date, Test arm, Control, Hazard ratio, and Stated limitation. Rows for the empirical triplicate, the QSP run, the digital twin, and RASolute 302. The limitation column is not optional and is taken verbatim from the authors' own statements.*

[DRAFTING INSTRUCTION] *Then one paragraph stating the non-validation claim in full: the proximity is a chronology observation and a hypothesis-supporting one, and the three differences are sample size 1000 against 241, a combination against a single agent, and KRAS G12C against a primarily G12D and G12V population.*

5.3 Cost and Schedule

[DRAFTING INSTRUCTION] *full-apply builds Table 6: industry benchmark against author figure for the three work products, from the simulation source set. Columns Work product, Industry cost, Industry schedule, Author cost, Author schedule.*

5.4 Provenance

[DRAFTING INSTRUCTION] *One paragraph reading the figure, and naming the two crossing edges: the verification frame from H.R. 9510 v5 into the Phase 1 protocol, and the clinician objections from the clinician narrative into the PI adoption guide.*

Four evidence tiers drawn as containment rather than as a ladder. Nothing inside a container may be cited as though it were the container; which is the whole of the paper's evidentiary discipline.

Fourteen deposited works and the citation edges between them. The bill line and the trial line run in parallel and meet only twice, which is why the legislative drafts are not on the trial's path.

Nine components, one trust boundary, and one direction of travel. Records leave for the public archive; nothing returns, and no path from the model reaches a motion controller at any point.

6 Physical AI Governance

[DRAFTING INSTRUCTION] *full-apply* writes 7,000 to 8,000 characters from `applications/app-01-nih-pioneer-award/sections/sec-04-operation-governance.tex`, `applications/app-04-doe-genesis-mission/sections/` (*topology, closed loop, Gold Standard Science records*), `applications/app-08-nci-ctep/sections/sec-04-operation-governance.tex` (*adjudication*), and `funding/tripartisan-llm-support.md` (*the three model roles*). This is the section a clinician reads first.

6.1 Three Boundaries

[DRAFTING INSTRUCTION] *Three short paragraphs: the model has no path to the arms; stopping is bounded at 3 ms per arm and 500 ms system-wide and is measured, not asserted; every artifact is verified before use and logged with a timestamp.*

6.2 The Operative Day

[DRAFTING INSTRUCTION] *One paragraph explaining why both figures are needed: the sequence gives the conversation, the state machine gives the guards, and neither implies the other.*

6.3 How a Failure Propagates

6.4 What Is Released

[DRAFTING INSTRUCTION] *full-apply* builds Table 7 here: the three frontier-model roles from `funding/tripartisan-llm-support.md`, verbatim, with columns *Vendor*, *Role*, and *Artifact produced*.

One operative day as a message sequence. Every arrow reaching the robot leaves a human first, and the two audit writes are the only messages that cross the hospital trust boundary.

Six advisory states and the guard on every transition. Two guards can only be satisfied by a human action, and they are the two that separate a rendered recommendation from an executed motion.

One top event and every path to it. Three of the four branches are AND gates, so no single failure reaches the patient, and the one OR branch is the one governed by procedure rather than by hardware.

Six tables and the five keys that join them. Every released record can be traced to one participant and one operative step, which is what makes an independent re-analysis of the cohort possible at all.

Three vendors, nine roles, and the single review chain that connects them. No model reviews its own output, and the chain is drawn as a cycle because the second reviewer's finding returns to the author.

7 UC San Diego Moores Cancer Center

[DRAFTING INSTRUCTION] *full-apply writes 4,500 to 5,500 characters from `funding/potential-partners/UC-San-Diego/README.md` and `funding/potential-partners/UC-San-Diego/priority-steps.md`, plus `funding/potential-partners/Scripps/` for the alternate-route contrast. No figure is placed in this section: application 10 already carries the intake sequence, the authority diagram, the feasibility grid, and the approval dependency, and repeating any of them here would be duplication rather than a new perspective.*

7.1 The Positioning Constraint

[DRAFTING INSTRUCTION] *One paragraph stating the constraint in full: UC San Diego is named as the intended partner of choice and nothing more; it is not described as a partner, sponsor, trial site, or endorser, and will not be without written authorization.*

7.2 Three Corrections the Site Research Forced

[DRAFTING INSTRUCTION] *full-apply builds Table 8: columns Claim as first drafted, Correction, and Where it now appears. Three rows, from `priority-steps.md` §1: daraxonrasib is not first-in-human; the robotic configuration must be named by manufacturer; model, cleared configuration, arm count, instruments and software version; no drug supply or letter of authorization exists. State that nine of the ten applications carried the first error until the PART I audit pass.*

7.3 Two Routes, Sequenced Differently

[DRAFTING INSTRUCTION] *full-apply builds Table 9 comparing the UC San Diego route with the Scripps route on four rows: entry point, first ask, the step at which the trial appears, and the risk if the route fails. Source both columns from the two site READMEs.*

8 Budget and Leverage

[DRAFTING INSTRUCTION] *full-apply writes 5,000 to 6,000 characters from `funding/RFA-RM-27-001-v2/LaTeXSourceFiles.zip` §9 (the \$700,000 per year and \$3,500,000 total frame), each application's §5, and `funding/science-golden-age/chunk-08-annex-fiscal-year-2028-research-and-development-budget-priorities.md` (non-federal cost share, long-duration grants fully funded in year one, 3:1 prize leverage).*

8.1 One Budget, Ten Shapes

[DRAFTING INSTRUCTION] *full-apply builds Table 10: columns Application, Term, Annual direct, Total direct, Cost share, and Shape. Ten rows. The point of the table is that the same \$3.5 million appears as five years, as 36 months, as two SBIR phases, and as a cash component of a contributed consortium.*

8.2 Leverage

[DRAFTING INSTRUCTION] *Two paragraphs: what the contributed share is worth in kind, why it is not requested in cash, and how it answers the annex's cost-share directive. Do not invent a dollar value for the contributed column; state it as in kind and unpriced, because no agreement exists.*

8.3 The Binding Constraint Is Not Money

[DRAFTING INSTRUCTION] *One paragraph reading the figure: nine of the ten review clocks close before the site-agreement date, so the programme's schedule is governed by the institution rather than by any funder.*

Five years of cash on the left, contributed non-federal value on the right, and the two layers that appear on both sides. The contributed column is what the annex asks agencies to prioritise.

Ten submissions sent on one day and ten review clocks that are not the same length. The site milestones beneath them are the binding constraint: no award can start before the site agreement executes.

Five layers, executed twice. The left column is one operator with an LLM toolchain and a public repository; the right is the institutional equivalent. Only the bottom layer is common to both.

9 Build Method

[DRAFTING INSTRUCTION] *full-apply* writes 4,500 to 5,500 characters from *funding/pdac-funding-applications/prompts/prompt-apply.md*, *funding/pdac-funding-applications/sub-prompts/* (both schedules), and the five stage READMEs. Describe the method as a reproducible procedure, not as a narrative of what happened.

9.1 Two Schedules, Thirteen Sub-Prompts

[DRAFTING INSTRUCTION] *full-apply* builds Table 11: columns *Part*, *Stage*, *Output directory*, *Figures specified*, and *Commit floor*. Thirteen rows, five for PART I and eight for PART II. Source from *sub-prompts/part-i/README.md* and *sub-prompts/part-ii/README.md*.

9.2 Why the Diagram Split Is Uneven

[DRAFTING INSTRUCTION] *full-apply* builds Table 12: columns *Type*, *Count*, and *The question it answers*. Five rows: *mermaid* 6, *plantuml* 3, *d2* 4, *diagrams-python* 3, *graphviz* 4. State that the split follows purpose and that an equal split would have forced at least four figures into the wrong vocabulary.

9.3 What Is Reproducible and What Is Not

[DRAFTING INSTRUCTION] Two paragraphs. Reproducible: the prompt, the sub-prompts, the sources, the commit sequence, and every figure's construction notes. Not reproducible: the model's judgement at each step, which is why the author's review is a required stage rather than an optional one.

Five verification artifacts and the reviewer question each field answers. Every field is released with the cohort, and the two marked fields are the ones that can falsify the programme's central claim.

10 Risks and Limits

[DRAFTING INSTRUCTION] *full-apply* writes 4,000 to 5,000 characters. This section must be written against the paper, not for it. Source the limitations from `funding/supplementary/source-files/Daraxonrasib-Efficient-LLM-Trial-Simulations.zip` (the authors' own stated limitations), from `funding/potential-partners/UC-San-Diego/priority-steps.md` §1 (the three positioning corrections), and from the back matter of the ten applications.

10.1 What Is Not Claimed

[DRAFTING INSTRUCTION] *full-apply* builds Table 13: columns Claim a reader might infer, and What is actually true. At least six rows, including: that the simulations validate RASolute 302; that daraxonrasib is first-in-human; that a robotic configuration has been specified or cleared; that drug supply or a cross-reference exists; that UC San Diego has agreed to anything; that any patient has been treated.

10.2 What Would Falsify the Case

[DRAFTING INSTRUCTION] Two paragraphs naming the two falsifying fields explicitly: `credibility_score` failing to reproduce at 81.9, and `negative_results` being absent from a released cohort. State that both are released whatever they show.

10.3 Risks the Programme Cannot Retire Alone

[DRAFTING INSTRUCTION] *full-apply* builds Table 14: columns Risk, Who can retire it, and What the applicant can do meanwhile. Rows: no qualified site; no drug supply; no sponsor-investigator determination; robotic configuration not permissible; accrual below plan.

Back Matter

Abbreviations

[DRAFTING INSTRUCTION] *full-apply* builds a full-width two-column abbreviation table. Include at least: AMP, ARPA-H, CTEP, ctDNA, DLT, DOI, FNIH, FRO, HHMI, IND, IRB, ISGPS, KRAS, LLM, MTD, NIH, NSF, ODE, OS, PDAC, PFS, PK, PD, QSP, RP2D, SAE, SBIR, TIP, VVUQ.

Data and Code Availability

[DRAFTING INSTRUCTION] *One paragraph: every work cited to a DOI is openly deposited; the repository is at the URL on the cover; simulation code, verification notebooks, and every figure's TikZ source are in it. State the repository version, v4.4.0.*

Author Contributions and Conflicts

[DRAFTING INSTRUCTION] *One paragraph. Kevin Kawchak is the sole author. He is chief executive of ChemicalQDevice and holds no equity in Revolution Medicines or any robotic surgery vendor. No sponsor, contract research organization, or medical society reviewed this paper. The work was adapted using Claude Code Opus 5.*

Citation

[DRAFTING INSTRUCTION] *full-apply writes the citation block: Kawchak K. 10 Funding Applications: A Phase 1, First-in-Human, PDAC Clinical Trial Protocol of a LLM-Directed Robotic Whipple with Daraxonrasib (RMC-6236). Zenodo. 2026; 10.5281/zenodo.xxxxxxx, hyperlinked to <https://doi.org/10.5281/zenodo.xxxxxxx>. The placeholder is deliberate and is kept through final-apply.*

References
