

The Unsolicited Applicants

Two people asked to join a company that had posted no position. This packet answers both the same way, places them against the eleven-role staffing plan, and opens the three routes that could fund them, without an offer, a promise, or a name.

Abstract

In the week of September 21, 2026 two people wrote to the chief executive of ChemicalQDevice on LinkedIn, each on their own initiative, asking to work for the company. The company had posted no position and published no hiring information. Both found it through its public work: a dated record of papers, protocols and applications built around daraxonrasib, the molecule the FDA approved on August 26, 2026 as Rasonque [1].

This packet spends that signal. It answers both applicants with the same reply, places them against the eleven-role staffing plan that the company's federal applications would fund [2], lists the employer obligations that begin the day a first offer is accepted, and opens four routes that could pay for a first hire. Three letters go out today, each to three offices that own a rule the company needs answered. No offer is made, no interview is promised, and neither applicant is named anywhere in this document or in the public repository that holds it.

The packet's argument is narrow and checkable. A reviewer who scores a small business asks whether it can assemble the team its budget pays for. Two inquiries that arrived before the company recruited anyone are evidence on that question, and this packet states exactly what they show and what they do not.

How to read this

A reader with five minutes takes §1, the signal and why it is spent first, and §2, the action register that ends in the one approval this day asks for.

A reader who scores teams adds §3, the eleven roles and the six an unlicensed applicant can fill, and §5, the four routes that could fund a first hire together with the robotic Phase 1 those roles would run.

A reader checking compliance takes §4, the obligations before and after a first hire. §6 carries the positioning constraints, the method note, and the references, every one of which is a clickable link.

1 The Signal, and Why It Is Spent First

1.1 What arrived

Two LinkedIn messages, a few days apart, from two people who do not know each other and did not know the other had written. Each asked, in their own words, whether ChemicalQDevice was hiring. Neither was answering a posting, because there was none: the company has published no job listing, no careers page and no request for applicants, and it has used no recruiter. Each message named the company's public work as the reason for writing.

1.2 The standing fact behind every day of this block

On August 26, 2026 the FDA approved Rasonque (daraxonrasib), Revolution Medicines' RAS(ON) multi-selective inhibitor, as a first-in-class targeted therapy for metastatic pancreatic adenocarcinoma after prior systemic therapy [1, 3, 4]. The approval rests on the Phase 3 RASolute 302 trial, which reported a median overall survival of 13.2 months against 6.6 months for chemotherapy in the RAS G12 population [5, 6], and it followed the developer's Phase 1/2 program, registered as the Phase 1/1b study of RMC-6236 [7].

ChemicalQDevice's AI papers were developed independently of that program and simultaneously with it. In June 2025, while RASolute 302 was enrolling, the company ranked a daraxonrasib combination first of forty pancreatic cancer meta-analyses [8]. In August 2025 its ten-arm quantitative systems pharmacology simulation returned 12.8 months against 5.4 for chemotherapy [9]. Between June and August 2026, before and after the approval, it deposited a Phase 1 protocol, an investigational new drug application, a Phase 2 protocol and two funding applications around the molecule [10, 11, 12, 13, 14]. Each carries a date, and the chronology is kept in one public file [15]. That record is what the two applicants read.

1.3 Why two inquiries are evidence

Federal small-business review scores the team. Until last week the company's answer was a plan: eleven roles at 3.95 award-funded full-time equivalents and a \$521,000 personnel line inside a \$700,000 annual direct cost [2]. Table 1 sets out what two unprompted inquiries add to that plan, and, in the same row, what they cannot show.

Figure 1. The path from an unprompted LinkedIn message to a funded offer, with the two places the thread ends and the one point after which an obligation begins.

What a reviewer asks	What the two inquiries show	What they do not show
Does the company's work reach people outside it?	Two people read it and acted without being asked	How many read it and did not write
Could the company recruit on award?	Interest exists before any recruiting has begun	That either person would accept an offer
Is an eleven-role plan realistic?	Two inquiries arrived for a plan not yet funded	That either person fits a specific role
Would the team work inside the program's structure?	Both replies state the structured schedule first	Anything, until each person answers

Table 1. What two unprompted inquiries show a reviewer who scores the team, set beside what they cannot show, so that no row can be read as a claim of hire.

The right-hand column carries as much weight as the middle one. A company that presents two inquiries as two hires has turned evidence into a claim, and a reviewer who notices will discount every other number on the page.

Three features make the signal worth more than its size. It is unprompted, so it carries no selection effect from the company's own outreach. It arrived before an award, when most small businesses have only a recruiting timeline to offer a reviewer. And it is the first test of the priorities the chief executive set out on September 12, 2026, which the next subsection states as terms of work.

1.4 The three priorities, stated as terms of work

On September 12, 2026 the chief executive wrote to the President that the startup's priorities had changed to three: obedience over hard work and responsibilities; adaptation to existing authority, order, and structure; and a teamwork-based, early-rise, scheduled routine. Day 3 of this block answers the White House correspondence that followed. Day 1 applies the three priorities to the only people who have so far asked to work inside them.

Each reply says, before anything else about the role, that the team works a structured, early-start weekday schedule under established clinical and regulatory procedures. The interview plan in §4 tests the first two

priorities with two of its six questions: one asks for a time the candidate followed a procedure they disagreed with, and the other asks who decides when a procedure in a regulated study may be changed. A candidate who answers that the procedure's owner and the reviewing body decide has understood the program's structure before reading its protocol.

2 The Action Register

Everything this day proposes is in Table 2, in the order it should be done. Each row names the file that carries it by its number within the day directory, so that the chief executive can open the row and act on it without reading anything else first. Rows 1 to 5 can all be done in one sitting; rows 6 and 7 are rules that wait on events outside the company's control.

No	Action	File	Waits on
1	Reply to Applicant A on LinkedIn	linkedin-01	Nothing
2	Reply to Applicant B, same words	linkedin-02	Nothing; send the same day
3	Ask how contingent staff are named	email-01	Nothing
4	Ask three first-employer questions	email-02	Nothing
5	Ask what staff training is required	email-03	Nothing
6	Designate the payroll earmark	capital-01	An award, before any spend
7	Hold both employer form packs	form-01/02	An award and an accepted offer

Table 2. The day's seven actions in the order they are done, each with the file that carries it and what it waits on; five are done today and two wait on an award.

2.1 What the three letters ask, and of whom

Each letter goes to three offices, and each office is asked only what it owns. The National Institutes of Health are asked whether a Phase I application may name a person who is not yet an employee, supported by a letter of intent that is contingent on award, and in what form [16, 17]. The Small Business Administration, the E-Verify Contact Center and California Competes are each asked one labeled question in a single letter, so that each answer is given knowing what the others were asked [18, 19, 20]. The Moores Clinical Trials Office, ACTRI and the university's Office of IRB Administration are asked what training a research staff member who is not a university employee needs before being engaged in research [21, 22, 23].

None of the three letters names or describes either applicant. The applicants wrote privately and have agreed to nothing, including appearing in a letter to a federal office. The letters ask about rules, and the rules are the same whoever the people turn out to be.

2.2 What is deliberately not done today

No position is posted. A posting written because two people asked would be a posting written for two people, and it would invite applicants to whom a California employer must give a pay scale on request, for a role the company cannot yet fund [24]. No interview is scheduled, because an interview implies a decision that an award has not yet made possible. No form is filed, because both employer packs create obligations that begin only with a first payroll [25, 26].

The one approval this day asks for

Approve the same reply to both applicants, in the LinkedIn conversations they opened, and the three letters that open routes to fund them. No offer is made, no interview is promised, no position is posted, and neither person is named anywhere outside the conversation they began.

Figure 2. The eleven roles grouped by where each sits and who can fill it, with the six open roles in the accent color and the five licensed or sponsor roles in gray.

3 Eleven Roles, and the Six an Applicant Can Fill

The staffing plan behind the company's federal applications is published as document 14 of the La Jolla site package [2]. It names eleven roles at 3.95 award-funded full-time equivalents, prices them at \$521,000 a year in salary and fringe combined, and fits them inside a \$700,000 annual direct cost. Nine of the eleven are part-time, and the fractions are what make an eleven-person site affordable on that budget.

Table 3 reads the plan from the point of view of an unsolicited applicant. Four roles require a California clinical license and would come from the host institution. One is held by the chief executive. The remaining six require training and experience but no license, and those are the six the two inquiries could fill.

No	Role	FTE	Per year	License	Applicant fit
1	Chief executive, sponsor	0.20	\$42,000	None	Sponsor
2	Site principal investigator	0.10	\$34,000	Medical	Host institution
3	Sub-investigator, medical oncology	0.10	\$28,000	Medical	Host institution
4	Director of clinical operations	0.40	\$54,000	None	Open
5	Lead clinical research coordinator	1.00	\$88,000	None	Open
6	Regulatory and quality manager	0.45	\$52,000	None	Open
7	Investigational drug pharmacist	0.20	\$30,000	Pharmacy	Host institution
8	Systems engineer, safety officer	0.55	\$72,000	None	Open
9	Model governance lead	0.40	\$58,000	None	Open
10	Data manager and biostatistician	0.30	\$38,000	None	Open
11	Research nurse and navigator	0.25	\$25,000	Nursing	Host institution
Total		3.95	\$521,000		6 open

Table 3. The eleven roles with their award-funded effort and cost, the license each requires, and whether an unsolicited applicant could fill it; six roles are open.

The six open roles carry 3.10 of the 3.95 full-time equivalents and \$362,000 of the \$521,000 personnel line. That is the part of the budget a reviewer would expect a small business to recruit for itself, and it is the part

the two inquiries speak to. The licensed roles are drawn from the host institution under a site agreement, which is why no unsolicited message is ever routed to them.

3.1 What the six roles do in the robotic Phase 1

The trial the roles would run is an open-label, single-arm, 3+3 dose escalation of perioperative daraxonrasib at 160, 220 and 300 mg with a 28-day dose-limiting toxicity window, in up to 18 treated participants undergoing a staged eight-arm robotic pancreaticoduodenectomy [10, 11]. Each open role owns a part of that design that no other role can cover.

The lead clinical research coordinator runs consent, screening and every study visit, and is the only full-time role on the award. The director of clinical operations closes the activation checklist and hosts monitoring visits. The regulatory affairs and quality manager holds the correspondence with the review board and the agency. The systems engineer and site safety officer owns the 3 N per-arm and 18 N cumulative force limits, the 3 ms cross-arm stop and the 500 ms system stop. The model governance lead holds the boundary that keeps the on-premises language model advisory only. The data manager and biostatistician convenes each cohort review and locks the database.

3.2 Why the licensed roles are never recruited this way

A site principal investigator, a medical oncology sub-investigator, an investigational drug pharmacist and a research nurse are licensed clinicians whose time on the trial is contributed under the site agreement. Recruiting any of them through an unsolicited message would bypass the institution that credentials them, and the sponsor-investigator firewall in the site package requires that every investigator decision sit with the site rather than with the company [2].

4 Obligations Before and After a First Hire

A company that has never employed anyone has no policy history, so its first two conversations become that history. This section lists what California and federal law require of an employer from the moment an applicant writes, and it sets the rule this company follows where the law does not yet reach a business of its size. Table 4 is ordered by when each obligation begins.

Obligation	Trigger	Deadline	Source
No pay history question	Any applicant	Always	Labor Code 432.3(a)
Pay scale on request	An applicant asks	A reasonable time	Labor Code 432.3(c)
No conviction question	Before an offer	Until the offer	Gov. Code 12952
Workers' compensation	A first employee	Before day 1	Labor Code 3700
Written pay notice	A hire	At hire	Labor Code 2810.5
Form I-9, Section 2	A first day of work	3 business days	USCIS
E-Verify, if enrolled	A first day of work	3rd business day	Labor Code 2814
EDD registration	Over \$100 in wages	15 calendar days	EDD
New hire report, DE 34	A start of work	20 calendar days	EDD
Records retention	An application	4 years	Gov. Code 12946

Table 4. Ten employer obligations in the order they begin, each with its trigger, its deadline and its source; the first three already apply to the two LinkedIn replies.

The first three rows apply today, to two people who have written but have not been offered anything [24, 27]. Both LinkedIn replies are drafted against them: neither asks about pay, both offer the pay range on request, and neither asks anything about the applicant beyond their experience and their consent to be named. The Fair Chance Act binds employers of five or more, and the company has one member and no employees. It

follows the rule anyway, because a policy adopted before it is required cannot later be said to have been adopted for a particular person.

Rows 6 to 9 begin only with a first day of work [28, 19, 29, 25, 26]. Their field-by-field content is prepared in the day's two form packs and held, because filing either early would create obligations for wages that do not exist.

4.1 Equal treatment, by construction

The two replies are identical in substance, and the interview plan asks both applicants the same six questions in the same order, scored 0, 1 or 2 against the same written rubric for a total out of 12. Two of the questions test the first two of the chief executive's stated priorities: a time the candidate followed a procedure they disagreed with, and who decides when a procedure in a regulated study may be changed. A third asks what about an early-start, scheduled weekday would be hard, and the only wrong answer to it is a false one.

A total is a record, not a decision. No offer follows any score until an award is made, and the scoring notes are written during the conversation rather than reconstructed afterward.

4.2 Privacy

Neither applicant is named in this packet, in the repository that holds it, or in any letter sent today. The files refer to Applicant A and Applicant B in the order their messages arrived. The first name each reply needs is typed into the LinkedIn message box at the moment of sending and never written into a committed file. Resumes, notes and scores are kept in the company's private applicant log for the four years California requires.

4.3 Employee, not contractor

Both roles, if offered, are employee positions paid through payroll. California decides whether a worker is an employee or an independent contractor with the ABC test in Labor Code 2775, and a coordinator or engineer who works the company's schedule, under its procedures, in its usual course of business fails every prong of the contractor side. Neither applicant is offered a contractor arrangement as a way to start sooner, however much sooner it would be.

5 Four Routes That Can Fund a First Hire

An applicant's first question after "is there a role" is "is it paid for," and the honest answer today is "not yet." This section sets out the four routes by which a first hire could be paid, what each is worth, what gate stands in front of it, and where it stands after today's letters. Only two of the four can pay a salary. The third rewards jobs after they exist, and the fourth bridges a timing gap and is never a source.

Route	Amount and window	Gate in front of it	Status today
NIH SBIR Phase I	\$306,000 over 9 months	PI employed by the company	Letter 1 sent
NSF SBIR Phase I	\$305,000, 6 to 18 months	A Project Pitch invitation	Pitch on day 4
California Competes	A negotiated tax credit	New California jobs	Letter 2 asks
Company reserve	\$40,000 for 13 weeks	Award letter and offer	Rung A named

Table 5. Four routes that could pay for a first hire, with what each is worth, the gate in front of it, and where it stands today; only the first two can pay a salary.

The two federal routes are close in size and different in shape. The NIH Phase I is the company's own planned budget of \$306,000, carried unchanged from its ten-application work [30, 16]. The NSF Phase I ceiling under the current solicitation is \$305,000, and NSF will not take a full proposal without first inviting one through a Project Pitch [31]. A consenting applicant could be named in either, in the form the NIH letter asks about, and never in both for the same effort.

Figure 3. The four routes as records under one root, with the same five fields on each, so that amount, window, gate and status are read straight across the rows.

5.1 The money frame a first hire sits inside

None of the numbers below is re-derived for this packet. The program's direct cost is \$700,000 a year for five years, \$3,500,000 in total, of which \$521,000 a year is personnel across 3.95 full-time equivalents [2]. The SBIR route through Phase I at \$306,000 and Phase II at \$1,300,000 totals \$1,606,000, leaving a delta of \$2,104,000 that the SBIR route does not buy; the capitalization plan places \$5,900,000 of private capital behind a firewall against that delta, a private to federal leverage of 3.67 to 1 [32]. The company's comparable virtual trial work is **projected** at \$36,330 per run, and that figure describes simulation work already deposited rather than the cost of the clinical trial.

5.2 What a funder buys when it pays for these roles

A funder who pays for the six open roles is paying for the people who would run a specific trial: open-label, single-arm, 3+3 escalation of perioperative daraxonrasib at 160, 220 and 300 mg, up to 18 participants, a 28-day dose-limiting toxicity window, and a staged eight-arm robotic pancreaticoduodenectomy with 56 degrees of freedom, 640 sensor channels and a five-vessel no-fly gate, advised but never controlled by an on-premises language model [10, 11]. The evidence behind the agent choice is dated and public: a 2025 simulation that returned 12.8 against 5.4 months [9], and a 2026 Phase 3 readout of 13.2 against 6.6 months in the RAS G12 population [5]. That proximity is a chronology observation, not a validation claim: the simulation modeled 1000 patients and a combination, and the trial enrolled a different population on a single agent.

Pancreatic ductal adenocarcinoma remains the disease with the widest gap between incidence and survival in the United States [33], and the standard of care after resection is still combination chemotherapy [34]. The developer's own adjuvant Phase 3 in resected disease, RASolute 304, is now enrolling [35]. The perioperative, robot-assisted use this program proposes is a different question from either trial, and it is the question the six roles would be hired to answer.

6 Positioning, Method, and References

6.1 Positioning constraints

No position is open, no offer has been made, and no interview has been promised. Neither applicant has been hired, evaluated, or named, and neither is described anywhere in this packet beyond the fact of their inquiry. Naming a consenting person as prospective personnel in a federal application creates no obligation on either side until an award is made and an offer is accepted.

No agreement of any kind exists with UC San Diego, Moores Cancer Center, ACTRI, or any other institution, and none is described as a partner, sponsor, site, or endorser [21, 22]. No agreement of any kind exists with Revolution Medicines. Rasonque is approved for metastatic pancreatic adenocarcinoma after prior systemic therapy [1, 3], and the perioperative use this program proposes is not the approved setting and remains investigational. No investigational new drug application has been submitted [36], no patient has been treated, and no robotic configuration has been specified or cleared.

Nothing in the day’s capital instruction is investment advice or a recommendation to any other person. Federal award funds are never mixed with the company’s reserve. The virtual trial figure of \$36,330 per run is described as projected wherever it appears [32].

6.2 Method and reproducibility

This packet was produced from repository sources and from the public pages of the offices it writes to, and from nothing else: the roles, effort and costs from the site package [2]; the capital frame from the capitalization plan [32]; the Phase I budget from the ten-application work [30]; the trial design from the deposited protocol and investigational new drug application [10, 11]; the chronology from the repository’s own record [15]; and the daily format from the first block of funding actions [37]. Every recipient address in the day’s letters was checked against the page its office publishes before it was written in.

The three figures are drawn in TikZ from the specifications in the day’s `diagrams` directory, one each in the Mermaid, Diagrams and Graphviz vocabularies, and no raster image is used anywhere. Three frontier models divide the work in this company’s practice, one for repository-scale production and two for independent review [38]. The human author retains responsibility for every conclusion, and this document was adapted using Claude Code Opus 5.5 [39].
