Abstract

In the week of September 28, 2026 ChemicalQDevice answered four signals in four days: two unsolicited LinkedIn inquiries from job applicants, the SEC San Francisco Regional Office's word that it is taking the chief executive's request "very seriously", several White House communications after the September 12 message, and a National Science Foundation inquiry about applying to a multi-million-dollar pilot program. Sixteen letters, two LinkedIn replies and three submissions went out. This packet is the fifth day, and it spends no new signal.

It records every letter of the week against one rule. A letter earns one follow-up on the third business day after it was sent, counting only days the recipient's office was open, and only if no reply has arrived and the follow-up carries one new fact. By that rule, four letters asked for nothing and earn nothing, six have not yet earned a follow-up, two share one, one is held and one is superseded, and three follow-ups leave today: one to the National Cancer Institute's SBIR Development Center with a one-page Specific Aims [1, 2], and one each to the SEC office [3] and the FDA's Oncology AI Program [4]. The packet then states the robotic Phase 1 behind every letter in numbers a funder can check, and lists the funding routes the week opened, with the amount and the next step on each.

How to read this

A reader with five minutes takes §1, the week as one record, and §2, the day's actions and the weekly cadence the day adopts.

A reader asking why only three letters go today takes §3, the follow-up rule and the ledger of all sixteen letters.

A funder takes §4, the robotic Phase 1 in numbers, and §5, the routes opened this week. §6 carries the positioning constraints, the method, and the references, every one of which is a clickable link.

1 The Week in One Record

1.1 Four signals, one a day

Each signal of the week was answered on the day whose theme it fits: federal program offices on Monday, regulators on Tuesday, the structures the company works inside on Wednesday, and pilots and solicitations on Thursday. Table 21 sets the four beside the letters each produced and what each is waiting on. The SEC office's words are the only words of any office quoted in this block, and they are quoted exactly; no White House communication is quoted or paraphrased anywhere [5].

Day	Signal	Sent	Waiting on
Monday	Two unsolicited LinkedIn applicants	3 emails, 2 replies	NIH, the SBA, UC San Diego; each applicant
Tuesday	The SEC office, "very seriously"	5 emails	The SEC office and the FDA, on venue
Wednesday	White House communications	4 emails, 1 form	OSTP, the Genesis Mission, Moores
Thursday	An NSF pilot inquiry	4 emails, 2 filings	NSF on the Pitch; the pilot's gate
Friday	None	3 follow-ups	The same answers, each with a date

Table 21. The week's four signals, one a day, each with what it produced and what it is waiting on; Friday spends no signal and sends only the follow-ups that are earned.

1.2 The same week, drawn as a chain

Figure 13 draws the week as a chain of records, one rank per weekday, from the signal to the letters it produced to the answers still pending. The bold edges on the right are the follow-ups: Monday's and Tuesday's pending answers reach Friday's letters through the rule, and Thursday's letter to NIH joins Monday's in one consolidated follow-up. Wednesday's and Thursday's other letters reach nothing on Friday, because their interval has not yet run: theirs fall due on Monday and Tuesday of the following week.

Figure 13. The week as a record chain, one rank per weekday, with the follow-up edges that let Monday's and Tuesday's letters, and no others, reach Friday's three follow-ups.

1.3 The totals

Sixteen emails went out on the first four days, each to at least three verified addresses, drawn from a register of thirty-six. Two LinkedIn replies went on Monday, and two more are drafted today, each to be sent only if its applicant has answered. Three submissions were made: the White House contact form, the NSF Project Pitch, and the Research.gov organization record [6]. Two words are attributed to the SEC office, and none to any other office.

1.4 The standing fact

The trial behind every letter of the week is built around daraxonrasib, which the FDA approved on August 26, 2026 as Rasonque for metastatic pancreatic adenocarcinoma after prior systemic therapy [7, 8, 9]. The approval followed Revolution Medicines' Phase 1/2 program and its Phase 3 RASolute 302 trial [10, 11, 12]. ChemicalQDevice's AI papers on the molecule were developed independently of that program and simultaneously with it, from the June 2025 identification study [13] to the Phase 1 and Phase 2 protocols and the investigational new drug application of 2026 [14, 15, 16]. The perioperative use the company's protocol proposes remains investigational.

2 The Action Register

Table 22 lists the day's nine actions in the order they are done. The first reads every reply that arrived during the week, because a follow-up to an office that has already answered would be the one mistake this day exists to prevent. Each letter and each LinkedIn reply waits on a condition, and none is sent if its condition fails.

Figure 14. One working day as a topology of four places, with every letter passing the follow-up rule and the 5:30 approval, and the record read first next morning.

No	Action	File	Waits on
1	Read every reply of the week	The inbox	Nothing
2	Write to the NCI SBIR Development Center	email-01	No NIH reply; NIH open
3	Follow up with the SEC office	email-02	No reply; office open
4	Follow up with the Oncology AI Program	email-03	No reply; office open
5	Answer Applicant A	linkedin-03	Applicant A replied
6	Answer Applicant B	linkedin-04	Applicant B replied
7	Check the SBIR.gov registry record	form-01	Nothing
8	Close the week's capital ledger	capital-05	The last session
9	Adopt the weekly cadence	brief-03	Nothing

Table 22. The day's nine actions in the order they are done, each with the file that carries it and the condition it waits on; no letter leaves if its condition fails.

2.1 The cadence the day adopts

The last action turns the week into a rule. Figure 14 draws the weekly cadence as a set of places and the paths a letter takes between them: in through the inbox, the LinkedIn threads and the portals; through the 5:00 read and the 5:30 approval, where the follow-up rule is applied; out through the federal and West Coast windows; and into the record, which the next morning reads first. Every weekday keeps the same places and the same times, and only the theme of the two federal windows changes from day to day [17].

2.2 What the approval includes

Approving the day approves each conditional action with its condition, not the action alone. If the SEC office has replied, letter 2 is not sent and the reply is answered instead. If an applicant has not replied, nothing is sent to that applicant. If appropriations lapsed on October 1, the three federal letters wait until their offices have been open for three business days, and nothing else on this list changes [1, 3, 4].

The one approval this day asks for

Approve sending the three earned follow-ups, each only if its condition holds; answering each applicant who has replied, and no other; and adopting the weekly cadence, version 2, as the rule for every week that follows.

3 The Follow-Up Rule

3.1 The rule

A letter earns one follow-up on the third business day after it was sent, counting only days the recipient's office was open. The follow-up is sent only if no reply has arrived and only if it carries one new fact. A notice that asked for nothing earns none. Two letters to the same office in one week share one follow-up, and a later letter to an office supersedes an earlier one and starts its clock again. An applicant is never followed up: the company answers an applicant who writes, and waits for one who has not.

The rule is the first of the three priorities in the September 12 message, applied to the company's own correspondence. Obedience over hard work means waiting for the office that owns the answer rather than writing again because writing is work that can be done.

3.2 The ledger

Table 23 applies the rule to every email of the week. The due column gives the third open business day, the first on which a follow-up may leave, on the assumption that the office was open throughout.

Day	Recipient	Asked for	Due	Today
1	NIH SBIR program office	A personnel answer	Thursday	In letter 1
1	SBA, E-Verify, CalCompetes	First-employer answers	Thursday	Held
1	UC San Diego offices	Staff training access	Thursday	Superseded
2	SEC San Francisco	Venue, a record, a call	Today	Letter 2
2	FDA Oncology AI Program	Venue	Today	Letter 3
2	Anthropic, OpenAI, Revolution Medicines	Nothing; three notices	None	None
3	OSTP	The right office	Monday	Wait
3	Genesis Mission partnerships	A contributor's place	Monday	Wait
3	Moore's Clinical Trials Office	A contributor's role	Monday	Wait
3	NCI CTEP	Nothing; one fact	None	None
4	NSF SBIR	A route it missed	Tuesday	Wait
4	NCTI principal investigator	The gate in writing	Tuesday	Wait
4	NAIRR Pilot	Shared resources	Tuesday	Wait
4	NIH SBIR program office	Advice on scope	Tuesday	In letter 1

Table 23. The sixteen emails of the week against the follow-up rule, the three notices in one row, with the day each may first be followed up and what happens to each today.

Figure 15. The follow-up rule as five questions asked in order, each able to stop a second message, with the number of this week's messages each question stopped.

3.3 Why the NIH follow-up goes to NCI

NIH received two letters this week, a personnel question on Monday and an overlap disclosure on Thursday, both copied to the NCI SBIR Development Center. Two follow-ups to one office would be one too many, so one consolidated letter answers for both. It goes to the NCI center directly, because the application would be assigned to the National Cancer Institute, and because the center asks first-time Phase I applicants to send a Specific Aims page so that it can connect them with a program director [1, 2]. The page is summarized in §4.

3.4 What silence means

Nothing. An office that has not answered in three days has taken no position, and no file in this block describes silence as one. The follow-ups say so by what they leave out: none repeats a question more sharply, none sets a deadline, and each says it will not write again unless asked or unless it has a new fact.

3.5 The rule, drawn as the questions it asks

Figure 15 draws the rule as five questions asked in order, each of which can stop a follow-up, and sets beside each how many of this week's messages it stopped. Only a letter that passes all five reaches the federal window.

4 The Robotic Phase 1, in Numbers

Every letter of the week points back to one trial, and a funder deciding whether it is worth money needs to see that every part of it is specified to a number someone can check. Table 24 gathers those numbers from the deposited protocol, the investigational new drug application, the capitalization plan and the site package [14, 16, 18, 19]. Nothing in it is new; everything in it is checkable.

4.1 What the numbers say to a funder

The design is conventional where it should be and specified where it is new. A 3+3 escalation across three dose levels in up to 18 participants is the most familiar Phase 1 design there is. What is new, the robot and the model, is bound by numbers: a 3 ms stop across eight arms, a tip-force cap of 3 N per arm and 18 N in all, a five-vessel no-fly gate, a gate of at least 1,000 simulated procedures across at least two independent frameworks with a Unified Safety Level of at least 7.0 before any patient, and a language model with no route to act [14, 16]. A funder does not have to trust the company's judgment about safety; it can read the limits.

The evidence behind the agent is a dated chronology. In August 2025 the company's ten-arm simulation returned 12.8 against 5.4 months of median overall survival [20]; in May 2026 the developer's Phase 3 trial reported 13.2 against 6.6 in the RAS G12 population [12]; and the approval that followed reported 13.2 against 6.7 in the overall population [7]. The company calls the closeness a chronology, not a validation, because the populations, regimens and sample sizes differ. Pancreatic ductal adenocarcinoma remains the cancer with the widest gap between incidence and survival in the United States [21], and after resection the standard remains combination chemotherapy [22].

Parameter	Value	Source
Design	Open-label, single-arm, 3+3 escalation	Protocol
Dose levels of daraxonrasib	160, 220 and 300 mg	Protocol
Participants	Up to 18, with sentinel enrollment	Protocol
Dose-limiting toxicity window	28 days	Protocol
Primary safety window	Day 30; Clavien-Dindo III or higher	Protocol
Key secondary endpoints	R0 at day 90; fistula; 24-month survival	Protocol
Arms and degrees of freedom	8 arms, 56 degrees of freedom	Protocol
Sensor channels	640, at 80 per arm	Protocol
Positional accuracy	0.05 mm root mean square at 1,200 mm/s	Protocol
Emergency stops	3 ms across arms; 500 ms for the system	Protocol, IND
Tip-force caps	3 N per arm; 18 N across all arms	Protocol
Gate before any patient	1,000 simulated procedures, 2 frameworks	IND
Language model	Advisory only; no write access, no route	IND
Simulated survival, 2025	12.8 against 5.4 months; hazard ratio 0.25	Company QSP
Credibility battery	81.9 over 55 tests	Capital plan
Reported survival, RAS G12	13.2 against 6.6 months	RASolute 302
NIH Phase I, then Phase II	\$306,000 over 9 months, then \$1,300,000	Capital plan
Clinical conduct in Phase II	6 participants at \$48,000 each	Capital plan
Program direct cost	\$700,000 a year, \$521,000 of it personnel	Site package

Table 24. The robotic Phase 1 in nineteen numbers, grouped as design, procedure and safety, evidence, and money, each with the deposited document a funder can check.

4.2 The Specific Aims, in brief

The one-page Specific Aims sent with today's letter 1 proposes three aims for an NIH Phase I of \$306,000 over nine months [18]. The first fixes the model's context of use inside the protocol: the decisions it may advise on, and those it may never touch, which are dose assignment, dose-limiting toxicity calls and analysis.

The second evaluates the layer in simulated use with the site's surgical team, as part of the protocol's simulation gate. The third assembles the credibility evidence for that context of use, framed on ASME V&V 40 [23] and read against the FDA's draft guidance on artificial intelligence in regulatory decision-making [24], citing rather than repeating any NSF-funded verification results [6]. None of the three aims asks NIH to pay for what the NSF Pitch proposes.

5 The Routes Opened This Week

The week's letters opened or advanced eleven routes that could pay for part of the program. Table 25 lists each with its amount, where it stands at the close of the week, and the one next step it waits on. Four of them pay cash to the company only after an award the company does not yet hold, and the table says so rather than leaving a reader to infer it.

Route	Amount	At week's close	Next step
NIH SBIR Phase I	\$306,000; 9 months	Aims to NCI today	A program director
NIH SBIR Phase II	\$1,300,000; 24 months	After Phase I	Clinical conduct
NSF SBIR Phase I	Up to \$305,000	Pitch submitted	An invitation
NSF SBIR Phase II	Up to \$1,250,000	After Phase I	None yet
NCTI Readiness Pilot	\$1M to \$3.75M each	Not yet eligible	Phase II first
Strategic Breakthrough	Up to \$30M, matched	Not yet eligible	Phase II first
NAIRR Pilot resources	Compute, not cash	Asked Thursday	A reply
Genesis Mission	A subcontributor's place	Offered Wednesday	A reply
California Competes	A negotiated tax credit	Asked Monday	Jobs first
Contingent payroll earmark	\$40,000 ceiling	Designated	Checked Fridays
Private capital	\$5,900,000, in the plan	Ledger at \$0	The firewall first

Table 25. The eleven funding routes the week opened or advanced, each with its amount, where it stands at the close of the week, and the one next step it is waiting on.

5.1 The money frame the routes sit inside

None of the numbers below is re-derived for this packet. The program's direct cost is \$3,500,000 over five years, or \$700,000 a year, of which \$521,000 is personnel across 3.95 full-time equivalents [19]. The NIH route of \$306,000 in Phase I and \$1,300,000 in Phase II totals \$1,606,000, of which \$1,396,000 is direct, leaving a delta of \$2,104,000 that the route does not buy; the capitalization plan places \$5,900,000 of private capital behind a firewall against that delta, a private to federal ratio of 3.67 to 1 [18]. The NSF routes [6, 25] would pay for the verification work, which the NIH route then cites rather than repeats, so that no dollar is counted twice. The company's comparable virtual trial work is **projected** at \$36,330 per run and about one month, against industry benchmarks above \$120,000 and 4.5 months [18]; that figure describes simulation work, not the cost of the clinical trial.

5.2 The registry every route will ask for

Every SBIR route in Table 25 will ask for the company's registry record: NIH on the SBIR/STTR Information form of each application [26], and NSF before a full proposal [27]. The record is issued by the Small Business Administration's company registry [28]. Today's form pack checks its seven fields at the close of a week that brought two applicants and a private capital question, and records that neither has changed the company's employee count or ownership, because no offer has been made and no equity sold.

6 Positioning, Method, and References

6.1 Positioning constraints

A follow-up is a courtesy to an office that has not yet answered, and nothing in this packet describes silence as a position. The SEC San Francisco Regional Office is quoted only in the two words it wrote about the request, and the follow-up to it repeats none [3]. No White House communication is quoted, paraphrased or described as an award, an appointment, an endorsement or a commitment [5]. Neither applicant is named, and neither is told that the other exists. No agreement of any kind exists with any office or institution written to this week, and none is described as a partner, sponsor, site or endorser.

Rasonque is approved for metastatic pancreatic adenocarcinoma after prior systemic therapy [7], and the perioperative use this program proposes remains investigational. No investigational new drug application has been submitted, and no patient has been treated. The company holds no NSF or NIH award and is not yet eligible for the NSF pilot. The private capital figure is a plan, not a completed raise, and nothing in the day's capital instruction is investment advice.

6.2 Method and reproducibility

This packet was produced from the repository's own record of the week: every letter, reply and submission of the first four days, read into the ledger of Table 23; the trial numbers from the deposited protocol and investigational new drug application [14, 16]; the money frame from the capitalization plan and the site package [18, 19]; the cadence from the first block of funding actions [17]; and the registry and program director guidance from the pages of the offices that publish them [28, 2]. Every recipient address was checked against the page its office publishes.

The three figures are drawn in TikZ from the specifications in the day's diagrams directory, one each in the Graphviz, Diagrams and Mermaid vocabularies, and no raster image is used anywhere. Three frontier models divide the work in this company's practice [29]. The human author retains responsibility for every conclusion, and this document was adapted using Claude Code Opus 5.5 [30].
